doesn't seem to work optimal, because the vectorized PIC's look not so close
to the original. They are both available in Germany only.

1555. Slow motion problem FIXED-Summary

Newsgroup: comp.sys.atari.st
Date: 1990-08-31 22:07:25 UTC
From: cs63bld@unccvax.uncc.edu
Message-ID: <2656@unccvax.uncc.edu>
Source record: 238928

Many thanks to all the people who responded to my call for help!

It appears that the slowness of writing to large GEM partitions on a
HD is caused by a TOS 1.0 bug. It can be patched by running FATSPEED.
FATSPEED.ARC should be available at any large archive site. The improvement
is impressive!

Thanks again,
Brian
(cs63bld@unccvax.uucp)

A networking product from Atari? I'd like to know more about this, and soon.
I've almost given up on getting STs on ethernet. How many other machines on
the market are so totally lacking in connectivity? I couldn't think of any.
Even the little laptops have the Xircom gadget that plugs into their printer
ports.

I'm typing this on an ST, with a thinwire cable running behind it to the spot
where a workstation will be next week. When that is up and running, this
ST will be retired. Other STs now in use will be moving to terminal servers to
be used as terminals. It is extremely hard to justify buying any new machine
that cannot be networked. I hope Atari realizes this and bypasses their
traditional one-year post-announcement waiting period and starts selling the
stuff now. With software...tcp/ip, ftp, telnet, all the usual stuff, please?
Nice and standard. Nothing weird or mutated. Please?

1558. Source code routines for picture loading/writing wanted

Newsgroup: comp.sys.atari.st
Date: 1990-08-31 23:33:21 UTC
From: stabl@trillian-gw.fmi.uni-passau.de
Message-ID: <STABL.90Sep1003321@trillian-gw.fmi.uni-passau.de>
Source record: 238917

For an extension of the program showdvi (displays TeX-DVI files on ST monitors, available on various hosts for anonymous 'ftp'ing) I'm looking for source code routines (in C) in order to read the various ST picture formats. At the moment I've only implemented the GEM-IMG picture format (loading only).

I'm looking for routines for loading the pictures into a bitmap and storing a bitmap as given picture.

Please do not send such routines directly via e-mail since we have to pay for every *received* email, references and hints are welcome.

Some examples for picture formats:
TIFF, IFF, GIF, GEM-Metafiles, IMG (storing), ...

Since showdvi (and dviprint, this programs prints DVI files on various printers) allow a flexible page size the picture format should not be fixed to screen size.

About dead components, have you tried using Atari's replacement service? This is where you send them your dead whatever, a small fee, and they send you a brand new unit.

I've known those who have sent in dead 1050 drives and got back XF354, 1027s and got back XDM121s, and even dead Megas, and got new Megas back. So, contact Atari, send them your dead SM124, and they'll send back a new one.

>...

>What's going on here?
>...

The problem I know. I think You dont't have TOS 1.4. Before TOS writes a new
file, it searches from the beginning of the partition for the first free
cluster and in the older TOS that needs that time. In TOS 1.4 that is much
faster, so it doesnt bother.
When I had the older TOS, I made me a program, that worked interactively
and could find all files that lie in the first 256k and then shift them to
another place on the partition. If the beginning of the partition is free,
writing new files is very much faster.
For first help You can save all files to another Partition or archive,
free that partition, write a file as filler to that partition, restore the
partition and then delete the filler.

>MS-Word that this is a TEXT only file it still looks like gobbledy gook.

I have successfully transferred binhex files (from comp.sources.mac)
which I downloaded on the ST to Spectre and extracted the Mac binaries
with Stuffit 1.5.1, so the problem is not with the transfer, it is with
the applications you are using.

1568. VIP Problem due to AMCGDOS

Newsgroup: comp.sys.atari.st
Date: 1990-09-01 14:13:12 UTC
From: silvert@cs.dal.ca
Message-ID: <1990Sep1.141312.16944@cs.dal.ca>
Source record: 238925

I recently posted a problem about damaged menu appearances in VIP Professional. The problem turns out to be due to loading AMCGDOS.PRG in my AUTO folder -- no AMCGDOS, no problem.

I did verify that the VIP was not damaged -- running from the original disk (write-protected of course) showed the same problem.

Also, ALTBOOT did not work with AMCGDOS installed -- I though ALTBOOT came first, but I will have to check. I'd hate to have to choose between VIP and Gemini!

Source record: 238944

Hi everyone.

I would like to tell you a little bit about Free-Net.

Free-Net is a system much like Compuserve but is completely free to use.

It also has an Atari SIG which isn't as active as it should be but
contains great information including recent online magazines.

If you are interested in trying out Free-Net, the IP Address is:

"freenet-in-a.cwru.edu"

I am uploading two issues of the Atari SIG's recent newsletters to tell
you more about the Atari SIG. They are pretty long so you may just
want to abort them before reading it all but it does contain some pretty
good information.

Free-Net is once again completely free to use.

I do not want to take users off this system and have them use the Atari SIG
instead but I wouldn't mind seeing some people use it as well.

Len

Words from the Editor

Happy Father's Day and welcome to the first issue of the Cleveland Free-Net Atari SIG's On-Line Newsletter. WE hope you enjoy it and will continue to bring you news, reviews, and articles every other month.

It may seem a little ironic that we would start a newsletter at probably one of the most depressing times in almost every Atarian's life but that is exactly why we started one. In this newsletter, we will not concentrate on what Atari is doing wrong but instead we would like to concentrate on what great things there are for your computer and how you can better use your Atari.

The Lynx is out and it is being advertised by Atari and just in time. It seems as if Nintendo, NEC, and Sega are all bringing out new portable game systems. Each of these new portable systems will be able to run games from their existing home system - something I'm sure Atari didn't think they would do. But Atari has a chance if they get in a lot of America's homes by this Christmas. The Stacy's hard disk drive problem is being fixed and already the Stacy is said to be the ultimate MIDI tool not to mention an ultimate Mac Portable! Rumor has it that the "Atari Advantage" package will be out by Fall in the U.S. and will consist of the STe (hopefully!) and a bundle of software to be sold in K-Mart type stores. A few rumors have it that a multi-million dollar advertising campaign to promote the STe and Stacy computers in the U.S. has indeed been signed. Of course, I cannot guarantee that all of this is true but is seems as though it is about time that rumors like these start becomming true. The last bit of hope that I can give you is

from Sam Tramiel himself. I received a letter from him about two weeks ago that said, "Please keep the faith strong in Atari" and "you won't be disappointed at year's end." I believe I won't.

Hmmm. What do we have for you in our very first issue? Everything.
We formally introduce the Portfolio by giving you a review on it.
A review for probably the most powerful product for the Atari 8-bits that brings you past MS-DOS is SpartaDOX X. SpartaDOS X as you will find out is why 8-bitters are still 8-bitters- it is probably the best kept secret.
We bring you tons of reviews of software and products for the Atari ST.
We bring you an article on what to do about Atari. What new titles are coming out from Sierra for the Atari ST. And much much much more!

Len Stys

What to do about Atari?

by

Kevin Steele

Recently, with the continuing slide of Atari's US market share, there have been a large number of angry voices crying out, demanding that Atari get its act together and release all those wonderful new machines it has been promising for the last two years. Many have threatened to sell their equipment and get Macs or clones if the new computers aren't out in this month or that month. For those of you bemoaning the current status of the ST market in the United States, I'd like to propose a little experiment:

1. First, sit down in front of your ST. Okay, are you seated?
2. Next, say these words directly at the monitor:
"Atari has abandoned the US market!"
3. Observe any reaction from your ST.

Did your machine stop working? Did it evaporate before your eyes? Did it run screaming from the room, spewing floppy disks? I thought not. Point is, odds are your ST neither knows nor cares what the current state of the U.S. ST market is--no matter what kind of strangeness goes on down in Sunnyvale, odds are your ST will continue to do what it has always done, unperturbed by rumors or vaporware, undaunted by the now-famous Atari 'revolving door' employee policy.

You have to ask yourself one very important question:

"Does my current computer meet my current computing needs?"

If it does, then there is no reason for you to panic every time a new computer is a couple of months or years late. Why be panic-stricken that the STe, Stacy, TT, or whatever is late when you really aren't going to buy one right away anyhow? I don't know about you, but my current system more than meets my needs, and I'm not going to start worrying about which computer to buy until such time as I see a genuine need to buy a new computer.

My ST system has more than enough muscle for my needs, and my needs are pretty big. As a freelance technical writer, I spend eight hours or more a day in front of my ST, churning out page after page of manuals, diagrams, invoices, and such. I've gotten nothing but positive remarks on the quality of the work I've created with my Atari ST, and as long as I can continue to produce professional-quality work in an expedient manner with this system, I see no reason to waste time worrying about what my next type of computer will be.

However, don't interpret any of the above as any sort of 'glossing-over' of the current status of Atari and their US policy -- my personal views of Atari's management style really aren't that positive. However, unlike many notable ST owners, I've made a conscious decision to stay out of the pulpit when it comes to the ever-popular "Atari-Bashing" sermon. If you've owned an ST for more than a month, you're bound to have heard it -- that endless diatribe on the evils underfoot in Sunnyvale, about the doom that each of us faces if Atari doesn't tow the line and submit to our wishes.

Why do I avoid "Atari-Bashing" when I share the same negative views? Well, think of it as a cost/benefit analysis: what will bashing cost me, and in what way will I (and others) benefit from it? In my opinion, bashing tends to simply make one look like a whiner, especially since it really doesn't yield any tangible benefits. If you're not a member of Atari Corp., you're powerless to instigate changes, and all of your angry Atari-Bashing screaming is just so much hot air in the wind. You'll save yourself (and others) an ulcer by avoiding this practice. Owning an Atari computer these days is discouraging enough with the scarcity of dealers and support--there's no need to add to the doom and gloom with endless tirades on the evils of Atari Corp.

The ST user community would be greatly enhanced if everyone who is currently spending their evenings "flaming" about Atari on local BBS's would instead upload a PD program, send in a shareware payment, participate in a user group, or spend a minute or two with another user who needs some help with their system. Take things in stride -- if your ST isn't affected by the current antics at Atari, then you shouldn't be either!

Kevin Steele

The Atari Portfolio (Review)

by

Tony Thomas

If you were to tell me a few years ago that there would be a full-function, 8088-based computer that you could hold in the palm of your hand, I wouldn't have believed it. Yet, I'm writing this article on just such a marvel of computer technology - the Atari Portfolio.

The Portfolio redefines the word "portable". When I bought my first portable computer - a CP/M-based Kaypro 2X - over five years ago, it weighed in at a hefty 25 pounds! Soon thereafter, I picked up another "portable" - a NEC 8201 (similar to Tandy Model 100) - which was a vast improvement, weighing in at about 5 pounds. The Portfolio, by contrast, tips the scales at just over a pound! In fact, I was even able to weigh it myself on a tiny Pelouze postal scale!!

Now, the obvious question is: Just how powerful is it? While the Portfolio won't do away with the desktop computer, it is the perfect portable supplement to it. Since it fits into a coat pocket and runs for more than fifty hours on a single set of batteries, the Portfolio is the perfect traveling companion that will be at home on a plane, in a hotel room or even at the beach.

Files can be transferred to and from the Portfolio to your desktop computer via the optional serial interface or to an IBM-PC or compatible via the optional Smart Parallel interface. Long term storage is also available via memory cards - an expensive medium (about $2-3 per Kilobyte) - limiting the Portfolio's usefulness as a stand-alone computer.

How compatible is the Portfolio with a PC? First of all, its internal memory is only 128K, making it only possible to run the most miniscule PC applications. Secondly, its operating system - DIP DOS - is similar to MS-DOS 2.11 in nearly every respect, except in the area of graphics. Since it does not permit direct screen calls and since the screen is only 40 characters by 8 lines), only simple programs that address the screen through DOS can be used. They mostly fall into the category of simple utilities.

The Portfolio, however, does contain some very useful application programs which replicate some of the more powerful mega-programs. The word processor is a simple ASCII editor with basic cursor movement and search and replace functions. It is adequate for routine tasks or for material that will be later edited and formatted on a desktop computer (though the Portfolio does offer some print formatting options allowing material to be printed directly from that machine). The spreadsheet emulates the basic functions of Lotus 1...2...3 Release 1A. Lotus spreadsheets (memory permitting) can be loaded into the Portfolio and vice-versa. The other applications (Address Book, Diary, Calculator) are similarly

straightforward and simple to use.

Is the Portfolio worth it? If you need desktop power in a tiny package, the answer is a resounding yes! While not as powerful as laptops like the Toshiba T1000, the Portfolio stands head and shoulders above PIMs (Pocket Information Managers like the Sharp Wizard and the Casio Boss) which are an electronic replacement to a Day Runner - address book/notepad/dairy. The Portfolio is a palmtop powerhouse that will enable you to untether the capabilities of your desktop computer and take it with you.

Tony Thomas

The "Atari Advantage" is a real advantage

by

Len Stys

In the beginning of this year, I wrote Sam Tramiel, President of Atari a letter. In this letter I stressed the fact that the "Power Pack" as it was then called was a great idea. The "Power Pack" now called the "Atari Advantage" was to consist of a 520STfm with a bundle of software to be sold at K-Mart type stores. What???! Put the precious Atari ST in K-Mart stores to make it a game computer? What about dealers? What about beig a serious business computer? How could I dare to even condone such a thing? Calm down and I will explain my reasoning.

Let's face it folks, Atari has no more than two dozen dealers in the U.S. and almost half of them rip us off because we have no one else to turn to. Need a TOS 1.4 chip installed? Sure, that will be $150 please. Or how about a 512k memory upgrade for your fm? That will be $250 please. I have never purchased hardware from my dealer that wasn't at retail price. The small number of Atari dealers may also explain why we don't see national commercials or magazine ads for the ST computer. Everyone is yelling, WHEN IS ATARI GOING TO ADVERTISE! What I would like to know is- how does Atari suppose to make any money when they advertise and their dealers only have a handful of computers on hand! They would not make enough money to pay back for the advertisements let alone make a profit. If Atari advertises in a city and there are one hundred people who want the computer and there is only one dealer with ten computers on hand, Atari will be losing out. They must have enough computers in a city to meet the demand when the advertisements create it. This brings up another question: why doesn't Atari just recruit more dealers? They have been trying but a lot of dealers would rather play it safe and stay with IBM and compatibles.

The big cry about the Atari Advantage package is that faithful dealers will get hurt by it. I do not see the logic in this whatsoever. I believe that Atari dealers will make out the best out of this deal. It is safe to say that these discount stores will not sell all the extras involving the ST line

of computers. Even if they do sell floppy drives, printers, and color monitors, they probably will not sell removable hard disks, hard drives, modems, laser printers, and monochrome monitors. As a new Atari Advantage user wants to expand his or her new system, they will go to Atari dealers to do it. So in this case, the Atari Advantage is really an advantage for dealers. Professional users who are into Desk Top Publishing or MIDI will no doubt go to Atari dealers for professional advise and help. This is where dealers will be able to sell the Mega ST professional computer system not to mention the Portfolio and hopefully new TT computer.

As for the ST becomming a serious business computer- you can forget it- or at least in large corporations. The new IBM and Macintosh computers have past the ST up in technology not to mention the new Amiga 3000. Why would a business purchase an Atari ST when they can buy faster and better computers from well known business computer companies? The TT will have to attack this market alone.

What about becomming a game computer? This is probably not a bad idea. Atari has equipped the new STe with 6 joystick ports, 4,096 colors, stereo sound, and better scrolling. I believe Atari will be trying to drive out the kiddies from Nintendo to the ST computers. Have you noticed? There are NO home/personal computers on the market? Remember what happened a few years ago? The video game market crashed and everyone who owned a video game system flocked to home computers. With the ST looking so attractive to children as a possible video game system and parents seeing the ST as taking their kids out of video games and into serious computers, Atari may have something hot here. The ST may be another C64 or even another Nintendo in the personal computer world but without competition for now.

The Atari Advantage package may be a way of getting some desperately needed users in the Atari world. With more users, there is more software, with more software, there is more users. I for one am willing to give up my ST as a professional system with only a few users to talk to in exchange for a personal/home system with thousands of users to talk to. I have seen user groups dwindle in size, I have seen Atari magazines go out of business, I have seen bulletin board systems close up due to lack of users, I have seen it all and I am getting tired of it. It is time Atari gets the ST out of its prototype stage and into America's homes.

The only thing that I was concerned about was the fact that the "Power Pack" was to introduce the 520STfm into the package. This would leave users with 512k even though most software being produced now requires 1 meg. This would actually put Atari back a step when they have the 1040STe ready to go. The STe would be perfect in the Atari Advantage package for it can be expanded easily in memory and has tons of nice features. I am glad to say that I am now hearing that the STe will be in the package instead and to me this was a great move by Atari.

The final question is when will this Atari Advantage be out? It should be out this Fall. The only thing holding it up is contracts with software manufacturers that Atari wants to include the STe with. Rumor has it that Atari has signed many major stores to carry the Atari Advantage already. A

rumor also has it that a multi-million dollar advertising campaign has also been given the OK for the STe, Megas, and Stacys. So you may want to consider saving up your money for this new package by Atari and get it for yourself, your children, or for me- it looks as if it will be a hit.

The Atari Advantage package should retail for around $400 and will include a disk drive, and tons of software.

Len Stys

Cleveland Free-Net with Z*Net

Several weeks ago, the Cleveland Free-Net became a proud official carrier of Z*Net Online Magazine as well as having an article about Free-Net published in Z*Net. Z*Net is one of the nation's best resources for recent news about Atari.

The SpartaDOS X cartridge
a review

by Doug Wokoun

The SpartaDOS X cartridge is the latest incantation of SpartaDOS for the 8-bit Atari and very possibly the most powerful Disk Operating System available for any 8-bit computer.

The SpartaDOS X cartridge consists of 64K of ROM, with 48K (or 6 cartridge banks) formatted into a ROM-disk, and the remaining 16K used as the main DOS core. The ROM-disk contains files and drivers used by the system and SpartaDOS X versions of several utilities found in the SpartaDOS ToolKit. It also contains a very versatile ARC utility package.

Some of the new features of SpartaDOS X (referred to as SDX):

o built in, memory resident FORMAT utility. Old versions of SpartaDOS could only initialize Atari format disks using 'AINIT'. To initialize a SpartaDOS disk required the loading of a program called 'XINIT'. Now, any time an XIO #254 call is made, the SDX format menu is brought up. With this, you can select a variety of disk densities and types. It will also allow "1-second" formatting by simply rewriting the root directory on a formatted disk.

o High speed disk I/O with U.S. Doubler, Atari XF551, and Indus GT disk drives.

o New file loader supporting relocatable files (certain disk based commands can be held in memory and later removed) and symbol linking.

o Probably the lowest MEMLO of any DOS. The DOS can load drivers under OS-RAM, into extended memory on an XE or at MEMLO on an 800.

o Environment variables: user definable PROMPTs, search PATHs, parameter passing on batch files, and a CARtridge or BASIC memory save capability will retain programs even if the machine is shut off.

o The ability to go from a cartridge to internal BASIC without rebooting. The CAR command enters the external cartridge, "BASIC" enters internal BASIC. You can go from Turbo BASIC XL to Atari BASIC to BASIC XE without rebooting! (with some provisions)

o Support of up to 1 Meg internal memory as a RAMDisk.

o "Persistent" batch files. Continued batch file processing even after loading binary programs.

o Fast, powerful, versatile ARC utilities. Supports ALF files. With these, you can Add files to an ARChive, Move (delete after Adding), Freshen (update files by date), Update (Freshen with Add capability), Delete files from an ARChive, View files in ARC, eXtract files, and Print ARC'd files to screen. The ARC utilities

also support password encryption and can function
with the screen off to increase speed. Also, all files are sorted
in alphabetical order when added to the ARChive.

o A new MENU program very similar to the MS-DOS XTREE.EXE program. This
program allows multi-file operations and displays the entire
directory tree, so files anywhere on a disk can be accessed easily.

o Command compatible with MS-DOS. Directory commands have several
aliases. CWD from disk based SpartaDOS can also be accessed
as CHDIR, or CD from SDX.

o Drives can be referred to by letter or number.

o Drives can be remapped. D1: can be SWAPped with D2:, etc. and from
that point on, any referrences to D1: will be sent to D2: and vice
versa.

SDX can be configured to take advantage of different hardware. A file
placed on D1: called CONFIG.SYS is used for this, or the default configuration
can be used. SDX can be configured to use OSRAM, or an extended bank of memory
for its drivers. With the right setup, MEMLO can be pushed to below memory
location $1000!

SDX uses a series of drivers to control most disk functions. SPARTA.SYS
is the main driver and must be installed. 'DEVICE SPARTA' is used in the
CONFIG.SYS file to do this. The number of sector buffers and file buffers
can be control by passing parameters to this driver. Another driver is
ATARIDOS.SYS used to read Atari DOS 2.x disks. Not installing this driver
saves memory, but then Atari DOS disks cannot be read. The SDX cart also
contains a RAMDisk driver which can be used to install up to 3 RAMDisks of
any size. An INDUS.SYS driver is used to program the INDUS GT to operate
at high speed. There are also two clock drivers, used depending on whether
or not you have an R-Time 8 cartridge.

A major change with the X cart is the way devices are addressed. Since
ICD wanted drives to be addressed by letter or number, conflicts would have
occured with existing devices. Also, ICD wanted SDX to be more similar to
MS-DOS, so those conventions were adopted. E: has become CON:, P: has become
PRN:, and D1: D2: and D3: are A: B: and C:. Switching between an IBM
machine and SpartaDOS X is much easier with these changes.

Another feature of SDX is its I/O redirection. With this, you can send
the output of a program to another device. Ex: DIR >>PRN: would do a
directory, but the results would be sent to the printer. Also, you can
use a file to "feed" a program with input redirection. Ex: BASIC <<file.ext
would call up internal BASIC and send it file.ext as if the contents of
that file were being typed into the machine. This would be used in place
of batch files because you can no longer send input to BASIC from a batch
file.

SDX recognizes two new file attributes in addition to protected, hidden
and archive. Hidden files do not appear in the directory, and archive is

used to mark files for backup. This is normally used with a hard disk backup program. When a file is updated, the archive bit is cleared, telling a program like Flashback that the file needs to be backed up. All of these are set with the ATR or ATTRIB commands (same thing). You can also scan directories for files with certain attributes.

Two new commands, PEEK and POKE make many operations easier. Instead of going to BASIC to execute these commands, they can be sent to the command line. PEEK will also display the value of the memory word stored at that location and the one following in hex and decimal.

Parameters can now be passed to batch files. In the batch file itself, these are referred to as %1 through %9. With this, you can create general purpose batch files to automate tasks.

Internally, SDX is very different from earlier versions of SpartaDOS. All of the files on the cartridge are relocatable and can be held in memory. COMMAND.COM, the command processor is one of these files. It is non-resident in nature and is unLOADed from memory when binary files are run. This saves about 4K of memory. It is reLOADed when the program is exited to DOS. Disk based programs written in relocatable format could be loaded at MEMLO, and held, eliminating the need to reload from disk each time. Unfortunately, information on how to write these modules is almost non-existant, so for now, only the programs on the cartridge can be held.

Some of the new commands and changes with SDX not mentioned above:

CHTD/CHVOL - now built in
COPY - now checks to see that there are two files specified. Files could be lost with disk based SpartaDOS by accidentally not specifying a second filename
DIR - /p directive pages output, /c directive gives file count.
DUMP - Hex dump of file
FIND - search all drives for filename
MEM - displays banks available, extended memory
PATH - Set search path
PROMPT - set system prompt with meta-strings
RS232 - now built in
SET - display/set environment variables
UNERASE - restore file(s)
X - load file/disable cartridge (for long binary files)

This is an incomplete listing of the features of SpartaDOS X. There are many others and new uses for the functions appear constantly. While learning to use SDX will take some time, it is well worth it in the end.

SDX is available direct from ICD. The ICD BBS contains a listing of ICD products available direct at prices much lower than through a store or even mail-order. Check for the latest price. ICD BBS: 815-968-2229.

Review & Hints

by

Robert Stys

In Police Quest II, you are Sonny Bonds, a promoted Police Officer from the first Police Quest to Homicide Officer. You are to capture or kill escaped criminal Jessie Bains. In the first Police Quest game, you put Jessie behind bars for his criminal activities and he is out to get anyone who had anything to do with sending him to jail.

I would first like to say that I enjoyed Police Quest II completely. I thought it was great and well worth the money I spent for it. It had great graphics and great sound. If you happen to have a musical keyboard, I would strongly advise you to hook it up to your ST and have the game play the music through the keyboard. And if you don't have a keyboard and play a lot of Sierra games, I suggest you get any kind that you can plug MIDI cables into from your ST into it. You will find hours and hours of enjoyment before finishing the game and when you do, you will say to yourself, this was a great game. If you like danger, romance, mystery, and excitement, Police Quest II is for you.

Is there anything that I didn't like about it? No, I can't say there is. Everything down to the Homicide Officer's Guide that comes with it is great. I wish however that Jim Walls, the designer of Police Quest would reconsider making a Police Quest III. He has just recently made Code Name: Iceman and it is suppose to be a big hit. He claims that he has run out of ideas but I can think of many. Perhaps he can try getting all the drug pushers off the streets or maybe gangs. I wouldn't even mind if some of the things he used in Police Quest I & II were repeated as long as they were in a different situation.

I have put together a list of hints for you in order to get through the game. In order not to spoil the game, I put them in the order of how you would need them.

1) Save your game often!

2) Try looking on the Captain's desk.

3) Try turning over the card that you have.

4) A bin is in the hall by counter that holds things.

5) Try going to the shooting range and adjusting your gun about 3 times during the entire game.

6) In the car, if the captain keeps calling you back, try getting in the car and type where you want to go before he starts calling you.

7) Be careful at Cotten Cove someone might be waiting for you...

8) Don't mind the stink, search it anyways!!!

9) Look at each tank and get the one that measures 2200lbs before diving.

10) Search the waters carefully for evidence.

11) Try looking in one of the toilets for a surprise! -not what you think.

12) Try drying the gun some how.

13) Remember- every officer even at an Inn may need backup sometimes, and if it helps, a search warrant wouldn't hurt!

14) Be careful when openning that door!!!

15) Have you looked in any jackets or under any turbans lately? It may just save a lot of people!

16) When all else fails, go to the bathroom! If that fails, go look for some towels! Only 70 seconds left, hurry!

17) Do the opposite of that of what you read.

18) Contact Keith when the mugger appears.

19) Look for the sewer hole, keep going even when you feel the gas is getting to you, then find the mask.

20) Tell your girlfriend to keep quiet for once!

If you need anymore help, send the Atari SIG a letter and I will be glad to help.

Robert Stys

Alpha Systems Music Products
(Reviews)

by

Michael and George Polly

When it comes to making the ST into a sound digitizer one of the best programs out is Digisound ST Professional by Alpha Systems. In the package comes a digitizer which slides into the card slot, the main program and a play routines for your own programs. The digitizer has 2 inputs, one for a mic and the other for any normal audio signal. It has 2 knobs, one to control the input level and the other to adjust the level of the output. The program itself has many options and many ways to manipulate the sound. It supports full editing, fade in, fade out, reverse, echo, pitch change, volume change and many others. You can play a digitized sound or sample at various pitches by pressing different keys on the computer or by way of a MIDI connected keyboard. Digisound can sample at rates from 5000 to 40000 samples per second and store the sound on disk in Digisound, ST replay, or Hippo formats. For testing the input level, an oscilliscope is built in. I find it fun to just stare at it or see what your voice looks like in the mind of the computer. A real time echo can be applied to the input which is quite interesting. All of this is tied together in GEM windows for easy use. I have used Digisound for a long time now and I still find it fun and somewhat useful to use.

Beat Box, also by Alpha Systems, is a drum machine that uses sampled sounds from Digisound or other digitizing programs to make drum patterns and sequences. Beat Box can play 4 sampled sounds at the same time from a selection of 11. Making the pattern is as easy as pointing and clicking. Playback is through either any digitizer hardware or the ST monitor.

The final product of this series, Jam Master, turns your ST into a four voice polyphonic sampling keyboard. Jam Master allows a MIDI keyboard to play sounds sampled by Digisound. The included four track MIDI sequencer lets you play along with a previously recorded song. You can even define the keyboard to play up to 32 different sounds depending on the keys pressed. As with Beat Box, Jam Master works with ST-Replay and Hippo hardware and sound files.

What is happening in the Cleveland Atari World?

by

Mark Leair

Press Release - Pro! BBS News Returns - Press Release:
Back by popular demand! Pro! BBS News, an official online newsletter for Pro! SysOps and users is returning. Issue one of volume two should be available for download July 1,1990, and should be available on the support board (assuming it's up...) and The Basement BBS node x127 216-381-7859 3/12/24oo bps. Once again PBN will like to hear from users and SysOps of BBS Express Pro! BBSs, articles gladly accepted to be considered for publication. The newsletter will also run bi-monthly/6 times a year.

Atari S.I.G.'ware: All summer volunteer programmers are working on public domain programs for the Atari computer. The idea behind this project is simple. To spread the word on the great service the Cleveland Free-net has to accomodate for Atari Users and to hopefully add some more enjoyment to Atari computers. If you would like to volunteer to write a public domain program for this great project, contact Mark Leair via Free-net at aa338 or on The Basement BBS (telephone number above).
Lastly, if you don't program, but would like to help, contact Mark on details on how you can write a game with no programming knowledge or for other positions.

-Editor's Note:
You can also contact Mark through the Atari SIG's address in the beginning of this newsletter.
-

TCP BBS II: Just as a lot of Atari boards are going down, TCP is being enhanced to a new and better version. Call the old TCP BBS for more information at 216/228-7335.

Time Zone: Time Zone is a new Cleveland BBS that seems like it will stick around for awhile. The SysOp has also just added an 8-bit section to the board so Atari 8-bitters won't feel left out. The number for Time Zone is 216/786-1701 at 300/1200/2400bps.

Free-Net Registration Fee Waiver and Free Membership!

Now for a limited time only! You may sign up for an account with the Cleveland Free-Net for absolutely no charge. And if you hurry, you may be one of our lucky users to get a free membership account. This means no timely fee for use of the system. To show the Cleveland Free-Net Administration how big the Atari community is, please include that you are an Atari computer user. Thanks!

---------- Start of first page

INSTRUCTIONS

Thank you for downloading this registration infor-
mation for the Cleveland Free-Net--a free, open-access,
community computer system brought to you by Case Western
Reserve University School of Medicine, in conjunction with
the Information Systems Division of AT&T and University

Hospitals of Cleveland.

The registration process is very simple. Below you will find three forms. The first of these is an agreement--the terms, if you will, of your participation on the system. This form MUST be signed and dated. The second is the registration form which provides us with, among other things, the information necessary to set up your "account" on the system and to enter you into the user directory. The third form is an optional one, but one we think is very important. It provides us with the basic information necessary to study the system and its utilization.

To register, simply fill out these forms and mail ALL THREE of them to:

The Cleveland Free-Net Project
c/o Community Telecomputing Laboratory
Wickenden 319
Case Western Reserve University
Cleveland, Ohio 44106

There is NO CHARGE for this registration process and NO CHARGE to utilize the system.

We will send you your ID number, a temporary password and a brief Users Guide as soon as possible. In the meantime, feel free to use the Free-Net as a visitor. The number is (216) 368-3888 (300/1200/2400 baud).

Thank you.

T.M. Grundner, Ed.D
System Administrator

---------- New Page

AGREEMENT

In exchange for the use of the Cleveland Free-Net Computer System, I understand and agree to the following:

1. That the use of the Cleveland Free-Net is a privilege which may be revoked by the administrators of that system at any time for abusive conduct. Such conduct would include, but not be limited to, the placing of unlawful information on the system, and the use of obscene, abusive or otherwise objectionable language in either public or, upon registration of complaint, private messages. The staff of the Cleveland Free-Net will be the sole arbiter of what constitutes obscene, abusive, or objectionable language.

2. That the Cleveland Free-Net reserves the right to review any material stored in files or programs to which all users

have access and will edit or remove any material which the Cleveland Free-Net, in its sole discretion, believes may be unlawful, obscene, abusive, or otherwise objectionable.

3. That all information contained on the Cleveland Free-Net is placed there for general informational and entertainment purposes and is, in no way, intended to refer or be applicable to any specific person, case, or situation.

4. That the Cleveland Free-Net does NOT warrant that the functions of this system will meet any specific requirement you may have; nor that it will be error free or uninterrupted; nor shall it be liable for any indirect, incidental or consequential damages (including lost data, information or profits) sustained or incurred in connection with the use, operation, or inability to use the system.

5. To abide by such rules and regulations of system usage as may be promulgated from time to time by the administrators of the Cleveland Free-Net.

6. In consideration for the privilege of using the Cleveland Free-Net and in consideration for having access to the information contained on it, I hereby release the Cleveland Free-Net, its operators, and any institution with which they are affiliated for any and all claims of any nature arising from my use of the Free-Net.

OPTIONAL PERSONAL INFORMATION

The Cleveland Free-Net is essentially an experimental system. It is a significant "first" in the field of computing and, because of that, we believe it will be the source of a great deal of study in the years to come.

To help facilitate our ability to learn more about this system and how it is used, we are asking that all registered users complete a brief questionnaire about themselves. This information will be kept completely confidential. At no time will it be made available in a form that is linked to your name, nor will it be made available to anyone for commercial purposes.

Answering these questions is optional. You will still be a fully registered user of the system if you do not fill them out. However, because of the unique nature of the system and the unusual opportunity we have here in Cleveland to study it properly from the beginning, we would like to urge you to help us out by completing these items.

Please fill in or check off the following:

1. What is your age? _____

2. What is your sex? _____ 1. Male
_____ 2. Female

3. What is your race?
_____ 1. White
_____ 2. Black
_____ 3. Asian
_____ 4. Hispanic
_____ 5. Other (Please specify _____

3. What is your educational background?
_____ 1. Completed a graduate degree
_____ 2. Completed a 4 year college degree
_____ 3. Completed at least one year of college
_____ 4. Completed high school
_____ 5. Completed the 10th or 11th grades
_____ 6. Completed the 7th, 8th or 9th grades
_____ 7. Completed less than the 7th grade

4. What is your occupation? (Please PRINT)

_____

5. What is your total approximate household income?

_____

THANK YOU FOR YOUR HELP!

---------- End of page

New Games from Sierra for the Atari ST
(Reprinted from Sierra News Magazine Vol.3, No.1)

Three New Products for ST Coming Soon!

At a time when many publishers are discontinuing or cutting back development on computers other than MS-DOS and Macintosh, Sierra On-Line is moving outside of these large markets to increase; development for the Atari ST, both in the U.S. and in Europe.

In the first quarter of 1990, Sierra has plans to ship no fewer than three new Sierra titles, with two of these planned between April and July. Due out soon are new Hero's Quest, Leisure Suit Larry 3, and The Colonel's Bequest. Later in the year, Conquests of Camelot and Codename: Iceman will be released for the ST in the U.S. and European markets (the ST is a particularly strong contender in Europe, especially in Germany).

According to Sierra Marketing Analyst Tony Caudill, "Although the Atari ST continues to be the smallest software market Sierra sells to, we are still looking for continued growth. In the U.S. the rolleplaying game cateogry, which is the cornerstone of Sierra's Atari ST business, is one of the few gaming categories that saw actual growth in the last 12 months. With our imminent release of German language versions of our most popular adventure games, we see great promise in our international ST business in the next year as well."

-
Editor's Note:

I have contacted Sierra and they tell me that most of these games should be out by the end of this month. I also heard that Space Quest IV is on its way!!!! For the ST, look at the beginning of next year.

I would also like to remind you of ONE VERY IMPORTANT THING... remember to send back your warranty registration card. This tells Sierra how many ST software titles have exactly been sold. The more of these they receive back, the more faster you will see new titles for the ST.
-

Lynx and new Lynx game cards

The Lynx is the only color portable video game system available. It has 4,096 colors, a 16-bit chip, 4 channel sound, super zoom and scrolling. The most fascinating thing about the Lynx is that you can connect up to 8 other Lynxs together to play real great games with each a different perspective. Other portable systems are in the works to challenge the Lynx but they probably won't be here until next year and with a higher price tag.

The Lynx has a retail price of $179.95 but can be purchased for cheaper. What a Christmas gift!

What good is a portable? The next time you are in a traffic jam, the next time you are waiting for your wife to get done shopping, the next time you have to wait for something with nothing to do, think to yourself that you could have had a Lynx.

Title available for the Lynx now are:

California Games, Blue Lightning, Electrocop, Gates of Zendocon, Chip's Challenge, & Gauntlet- The Third Encounter

New game cards coming by this Christmas include:

Flying Ace, 720, Paperboy, A.P.B, Rygar, Football, 3D Barrage, Road Blaster, Super Soccer, Checkered Flag, Tournament Cyberball, Zarlor Mercenary, Xenophobe, Klax, Rampage, Vindicators, Ninja Gaiden, Slime World, Turbo-Sub, Junkyard Dog, Ms. Pacman, and many more...

Up to 25 new game titles will be available by the end of the year.

Rampage - You're a huge monster trashing 175 different cities. The army will try to stop you, so eat as many soldiers and tanks as you can. Burp.

Klax - The latest arcade hit from Atari Games. You must form "Klax" from colored tiles tumbling down the conveyor belt. 100 levels.

Chip's Challenge - Help Chip through 144 challenging levels without getting nailed by cherry bombs, water traps, and literally hundreds of other hazards.

Gates of Zendocon - the hideous spider Zendocon has sent you deep into its web of 51 deadly universes. Survive each universe if you hope to return home.

Vindicators - 2 player version of the Atari Games Arcade hit. Drive your tank through alien stations to find and destroy main control areas.

Blue Lightning - You're flying the top secret Blue Lightning combat jet. But you have to survive missiles, ice fields, canyon walls and the dark of night.

Zarlor Mercenary - Fight your way through multi-layered 3-D landscapes. Fight well, and you will be rewarded with better armor and weapons.

Guantlet - The enchanted Star Gem has crashed to earth. Capture it from evil creatures before they use its magical strength to destroy man. 1 to 4 players.

Xenophobe - Four player version of the arcade hit. Aliens have infested the space stations. You lead an ill-equipped group of Astronauts to abolish the Alien Menace.

About the Cleveland Free-Net Atari SIG

The Atari SIG is a Special Interest Group servicing all Atari computer users. In the Atari SIG, there are many different sections which you may use.

One of the first sections that you may use is the User Group Information listing. Here you will be able to access information pertaining to the Atari user group meetings for the Cleveland area. It will contain the time, location, and date of the meetings.

The Atari News section is the place to go for all of the latest news being released that is related to Atari.

The General Bulletin Board is the place for Atari computer users to meet and discuss any problems, suggestions, or experiences that they might have.

The Specific Computer Boards option leads to several bulletin boards of different computer types. It doesn't matter what Atari computer you have, the Cleveland Free-Net Atari SIG supports it.

The Programmers' Forum is a section of the Atari SIG dedicated to all of the Atari programmers. This is where programmers can discuss with other programmers about any problems or solutions that they might have dealing with programming.

The Wanted & For Sale Board is the market place for Atari users. This is where users may post messages to sell their equipment or just let others know what they are looking to buy.

Another section which you may select is the Software/Product Information section. This part of the Atari SIG contains information on all of the software and products available for the Atari computers. This section includes reviews, summaries, and discounts on various

software and products.

The Atari Library section is a place where you can get old Atari SIG information, On-Line Magazines, and User Group Newsletters. You may also find various documents in the Information Base.

The Help-Line is the place to ask specific technical questions about your Atari computer. The SIGOps manning the Help-Line are ready, willing and able to help. Your question will be answered as soon as possible.

And finally there is a directory of all the Atari SIG members. This section is a database of all the Atari SIG members.

If you have any articles, reviews, product releases, or news that you wish to contribute to this newsletter, you are welcome to send them to us. We cannot guarantee that your contribution will be published in the next newsletter but probably will be. If you wish to send us a letter, or your contribution, you can send it to us by our U.S. mail address, Internet address, Bitnet address, or Free-Net address that can be found in the beginning of this newsletter. You will receive full credit for any contribution published.

SysOps of the Atari SIG are: Phillip M. Chow, Jim Haynes, Mark Leair,
_____ Scotty Meredith, Len Stys, Doug Wokoun,
Cleveland Free-Net Atari SIG| and honorary SysOp Kevin Steele.
Newsletter (c) 1990 |

The Cleveland Free-Net Atari SIG Newsletter is a bi-monthly released publication covering the Cleveland Atari Community as well as nationally. Opinions and commentary included in this newsletter are that of the authors and do not reflect those of the Cleveland Free-Net Atari SIG in any way. The Cleveland Free-Net Atari SIG Newsletter is copyright 1990 by the Cleveland Free-Net Atari SIG. Words from the Editor

As you may have heard, the Atari SIG was going to and did have a Mini-Expo. Was it a success? What happened at the Mini-Expo? What would we do that we didn't do this year if we have another expo next year? All of these questions will be answered in a special Atari SIG Mini-Expo report in this newsletter.

Also in this newsletter is going to be some information on why Atari shouldn't get frustrated yet over the upcoming depression that experts say we are headed for. We will have information on the new Atari STe and how there might actually be two versions of the same machine out in the U.S. - one that works and one that might be full of bugs- both being sold to you. We will give you information on some new things going on with Free-Net and how we can take advantage of Free-Net Version 2.2. A way to get around the lack of a file transfer section on the Atari SIG? It seems as if we have figured a way and two Atari SIGOps are organizing it. The Computers for Children of War campaign is taking off and we will have more information on that. A time, date, and channel to converse in multi-user chat for Atari users! Yes, multi-user chat is in place and we are taking advantage of it!

We also have some reviews such as the one about SEX (not what you think) by Scotty Meredith. Also a reprint of a few articles by Kevin Steele from NOAH Newsnotes. Kevin is not only the editor of NOAH Newsnotes but he is also the Atari SIG's new SIGOp on Free-Net. As a writer and desk top publisher who needs a computer that can crank out diagrams and charts that look professional he has a lot of experience using the ST for professional use. He should be pretty helpful to anyone that has any questions on how powerful

the ST is in a business.

The Atari SIG users listed in the user directory on the SIG will be receiving a special version of this newsletter concerning some recent information released from Atari concerning Cleveland. And again- this newsletter promises to be yet another informative issue for Cleveland and U.S. Atari users.

Len Stys

****

The Atari SIG Mini-Expo
By Len Stys

The Atari SIG Mini-Expo is now over and it was an expo that was very unique. Unlike other expos, the Atari SIG Mini-Expo didn't go to a motel or gymnasium and invite the public to come special for it, the expo went to where the public was going to be already. It was held during the Slavic Village Harvest Festival that was suppose to attract 100,000 people. Unfortunately, it rained a bit that weekend which not only drove a good number of people away but also Atari users as well. The main idea behind the expo was to get Atari users in the Greater Cleveland community together while also showing off some very nice Atari computing and Lynx equipment to the public who weren't aware of what Atari's could do outside the 2600. The Mini-Expo was publicized by Atari User Group newsletters (NOAH specifically), flyers, Z*Net Online Magazine, and surprisingly a subscribed Atari user group newsletter called NEO-STAG. All of these things promised great user attendance but many thought that the rain cancelled the festival thus cancelling the expo. The festival however wasn't cancelled and neither was the Mini-Expo. It did not even rain in the area of the festival as much as it did throughout the rest of the city. The expo was also located inside of a store so even even if it did rain bad, we wouldn't be effected by it.

What went on at the Mini-Expo? We got to finally Lynx-Up with other Lynx owners which was pretty incredible and in my opinion - the Lynx is ahead of its time- way ahead. I believe even with NEC's Turbo Express around the corner, it still won't beat the Lynx in linking up with other systems. By the way, a good number of kids came down and played and played with the Lynx vowing that they would get one or ask for one from Santa. There were also ST and XE computers set up by myself, Scotty Meredith, Doug Wokoun, and John Dernar. There were two STes at the expo supplied by Len Olenik from a company called, "TGIA Computers" which stands for Thank Goodness It's an Atari! I think that title says it all. Len sold software and products at about 30% off or better than retail. He claims that he will match any price of any mail order so as long it isn't ridiculous. He also sold European magazines for only $9 with disk! Monitor stand power surge protectors for only $20! And special Mini-Expo deals on software at the cost of only $10 each! Len said that he will continue the 30% discount or better on software and special deals on hardware for Atari SIG users only. So if you are on the SIG's directory then I think you are about to save some

money... His number is in the area code 216 but is still long distance
so you must first dial a 1 then 336-2215 when calling. Please note
that you should still support your local dealers but if you were going to
buy mail order anyways, you may want to give him a call... He was the only
vendor that cared to show up for the expo and we didn't charge him a vending
fee.

Overall, the Mini-Expo was a success. We showed people who came
in the store what Atari's can do and they were glad they came by. The
people that didn't make it are now hearing that it was pretty good and
wish they came. Hundreds upon hundreds of people walked past the store front
and looked through the window and read the signs stating ATARI COMPUTER
DEMONSTRATIONS but did not come in. But by us being there and those signs
being there, we made aware these people that Atari sells computers!
We also had some pretty big poster signs (thanks to Mark Leair's sister,
Sue) on top of the store stating Atari POWER Computing Demonstrations
that could be seen down the street by thousands... The only real misfortune
that we had was unexpected and that was several tents placed in front of the
store in which the expo was in. These tents belonged to the street vendors of
the festival and had never been placed there in the 12 years of the festival
before. This blocked most of the store from view and many people weren't even
aware that we were there. But overall, we had fun and the Atari users that did
show up didn't leave disappointed. And the Atari vendor that showed up assured me that it
was worth his time and effort and that the other dealers
didn't know what they were missing- especially future customers.

Will we do it again next year? You bet if the store is still vacant
and if no one thinks of a better idea. We will also take care of some problems
that we had this year. We will make sure that there is no obstruction in
the way of the store front. We will have speakers on top of the store
window playing the STe's stereo sound and perhaps even pass out some helium
Atari balloons...

****

What people thought of the first Atari SIG Newsletter

-Message #6 (47 is last):

-From: af611@cleveland.Freenet.Edu (Anthony V. Fernando)
-Subject: Re: Atari SIG Newsletter Vol.I No.1
-To: xx004@cleveland.Freenet.Edu

When I first joined Free-Net, I ran an Atari 800 personal
computer with 48k. About a year ago I got an 130XE.

I'm supprised that Atari has begun to give up support of the
Atari ST line. The ST quickly phased out the 8-bit Atari's.
In short, I'm glad the Sig still exists.

-Subject: Re: Atari SIG Newsletter Vol.I No.1
-To: xx004@cleveland.Freenet.Edu

Thank you for the newsletter. I'm very strong into using the
Atari for all my needs. In fact the school where I teach will be
converting to the ST during the school year 1991 - 92. I've had
an ST in my room, social studies, for three years now and other
teachers began to realize the power of the ST. The computer
teacher was so amazed that he began the process of converting. It
took a lot of convincing to get the administration to approve the
switch from Apples to Atari's. As of this year there are six ST's
in our school and by the end of the upcoming year there will be
about 15. Maybe sometime you might be able to start an
educational column. If so, maybe I can be of help. I do have
some educational software that I use in class. I'm always
looking for more. Once again, thanks.....

I still own the ST and use it just about every day. I can see that you have
done some homework and recruited a number of good people to help with this
SIG. If you need any other help, just let me know.

Blood, Sweat, and Smears
(or: How I Got Started in Atari DTP)

Copyright 1990, by Kevin Steele.
All Rights Reserved.
(Reprinted from NOAH Newsnotes by author)

Okay, so I finally did it--I quit my job and went Freelance
on a full-time basis. This step was similar to stepping out
of a 17th-story window on the assumption that someone below
will just happen to have a safety net in their pocket, ready and
eager to save your stupid skin. My previous jobs, namely thati]
of Documentation Specialist and Technical Editor, had already
introduced me to the wonderful world of publishing, and all
of the erratic rules thereof. I was prepared for any
potential publishing problem thrown my way, my head swelling
with terms like 'pica,' 'keyline,' 'repro,' and 'kerning.'

What I was not prepared for were things like project
proposals, quarterly estimated taxes, and devious little

things called 'penalty clauses' hidden deep within contracts. Well, to make things short, I managed to live through the experience, but after the smoke cleared, the problem still remained of how to equip my new 'Home Office' (actually, the second bedroom in my apartment) with all the necessary high-tech goodies and still somehow manage to eat on a semi-regular basis.

Step one was buying a computer. I was once given some very good advice on buying a computer: first, figure out what it is you want to do with a computer, then find the software that will let you do what it is you want to do, then find the computer that runs the software that lets you do what you want to do. Quite a mouthful, but good advice nonetheless. When the time came to equip my home office with a computer, I took that maxim to heart. As a writer, I wanted a 'friendly' computer to primarily use for writing and desktop publishing--so I wanted a Macintosh, right?

Wrong. My specialty is technical writing, and I had been trained on Ventura Publisher, which is a wonderful system for long documents. Okay, then, should I buy an IBM? I couldn't bring myself to buy one--I hated to have to give up all those wonderful Mac programs that have made it the top contender in the desktop publishing market. Should I buy both? This was completely out of the question, as I was on a very, very tight budget, and couldn't even afford to buy a basic Mac system, let alone both a Mac and an IBM computer. My solution? I bought an Atari Mega ST.

To someone unfamiliar with the Atari ST, this step would have seemed like buying a Yugo because you couldn't decide between a Ferrari or a Porsche. Luckily, I knew better. Like the Volkswagen GTI, the ST packs a lot of power under an unassuming front. I bought the ST primarily because of the emulators available, as I had serious plans on using IBM and Macintosh software for business, and maybe, just maybe, using the computer in standard ST mode to play a few games. As of this date, I have yet to use an emulator for any serious business application.

The reason I have sorely neglected my emulators is that the ST has met all of my writing and desktop publishing needs, and at a very reasonable cost. Sure, I could have gone out and bought Ventura Publisher, but why bother when an ST program like PageStream or Calamus meets my needs for $500-900 less? Like a bargain-hunter gone mad, I have found myself drawn again and again back to ST software over equivalent Mac and IBM software. The best part is, that quite often the ST version of a software package has features superior to the corresponding IBM or Mac version.

For instance, take WordPerfect on the ST. It includes such 'revolutionary' features as drop-down menus, mouse control, and re-sizable windows. The latest version of WordPerfect on the IBM, namely 5.1, has just now added mouse-controlled menus, and it still doesn't offer the same versatility with windows as the ST version. Another desktop publishing package that has superior features to the corresponding IBM or Mac counterpart is PageStream. With PageStream, you can rotate text and graphics, work on up to six documents at the same time, and produce color separations with crop marks. You can do none of these with PageMaker. With impressive ST packages such as these, I have had no need to buy the pricier, less-powerful IBM or Mac equivalent.

Since starting my writing career, my ST has been used to write manuals, articles, and stories; produce technical diagrams, maintain client lists, and track overdue invoices; and kill a few Dungeon Master baddies now and then (hey, all work and no play...). In all of these endeavors, I have managed to gain a detailed, nay, an intimate relationship with my software packages, and all of their associated bugs. Normally, a bug is nothing more than a minor annoyance. However, when your livelihood depends on your computer, each bug somehow suddenly manages to become a deep personal crisis. There's nothing like seeing two hours of work go 'poof!' the night before a project is due to help speed up the balding process, let me tell you from personal experience.

Well, I hope that this article has helped to provide you with the 'big picture' on my background, and how I got started in the fun-filled world of Atari DTP. I've managed to make a living as a freelance writer with my Atari computer now for almost two years, and I see no reason that my ST and I can't continue working together for years to come. In the final analysis, the true acid test of a business computer is whether or not it can produce the kind of professional-caliber results that you require. The ST may not be considered a serious 'business computer' by most, but don't tell that to my Mega!

****

What computer packages are being sold in Europe?

***** 520 STfm Discovery Package *****

High quality, good value package based around the 520STfm computer including 512k RAM, 1MB Drive and built-in TV modulator. Also supplied is

STOS Game Creator
Carrier Command
Space Harrier

First BASIC
Outrun
Bomb Jack
Neochrome
Atari ST Tour
plus "Discovering your Atari ST" book

All for around $450 American money

******* 520STe Power Pack *******

Includes the latest 520STe with 1MB drive, joystick, mouse, user guide, 5 disks of public domain software, plus an incredible selection of chart-topping software (value of around $800 American money). Sofware List includes:

R-Type
Afterburner
Double Dragon
Super Hangon
Space Harrier
Overlander
Pacmania
Starglider
Super Huey
Eliminator
Predator
Bombjack
outrun
Bombuzal
Xenon
Guantlet II
Black Lamp
Starray
Nebulus
Stargoose
First Music
First Basic
Organiser

All for around $550 American money

**** 1040STe Professional Package ****

Superb starter package consisting of a 1040STe with an excellent selection of starter software. Pack includes:

Kuma Wordprocessor
Kuma Database
Kuma Spreadsheet
Kuma Business Graphics
First BASIC
Hyper Paint
'Prince' game

STAC Adventure Creater

All for around $750 American money

-
These seem pretty good but Atari isn't the only one selling packages.
Here's a few from its rival- Commodore:

***** Flight of Fantasy - Amiga *****

Includes 512k RAM, 1MB disk drive, mouse, T.V. modulator, workbench software, Basic Language disk, F29 Retaliator, Rainbow Islands, Escape From The Planet Of The Robot Monsters.

All for around $700 American money

****** Batman Pack - Amiga ******

Includes 512k RAM, 1 Mb Disk Drive, mouse, T.V. Modulator, Workbench software, Basic Language disk, Deluxe Paint II, Batman the Movie, New Zealand Story, Interceptor.

All for around $700 American money

****

Cleveland Free-Net Atari SIG Related News

___Atari Conferencing using Multi-User Chat!___
_____

The Atari SIG users will be chatting online every Sunday at 8:00PM
on channel 1040.

The multi-user chat has just been implemented on Free-Net and we are
going to take advantage of it! Be there!

___Atari SIG founder retires as SIGOp___
_____

Jim Haynes, one of the first original Atarians and founder of the
Atari SIG on Free-Net will no longer be a SIGOp for the Atari SIG. However,
you will still see him around the Atari community and hopefully the Atari SIG.
Thanks goes out to him especially for getting the ball rolling.

___File Transfer? On Free-Net?___
_____

As you know, the Cleveland Free-Net does not have upload/download
sections for computer users but individual file transfer has just
been implemented.

Scotty Meredith is working on an ST P.D. file list for Atari SIG users.
Doug Wokoun is working on an 8-bit P.D. file list for Atari SIG users.
If you see a file you want on the list, you would make a request for it to them
and they will send it to you through file-mail. Also, if you have a file
that you don't see on the list then you would send it to them through file-mail

for them to place on the list and give to other users who may want it.

When asked when they would complete their list, Scotty and Doug
both stated that Free-Net will first have to increase the time the file
stays in a person's account. It is presently at 1 day before deletion
and that is really just too short. It needs to be there for at least several
days.

___New Free-Net version goes on-line!___
_____

1) Multi-User Chat
NOTE: Due to the nature of multi-user communication
(ie. lots of people typing at the same time) this
program requires the use of a "smart" terminal.
(for example vt52, vt100 or ANSI)

2) Kermit and Xmodem will be made available to everyone.
This will allow you to upload and download files to
your private work areas and transfer files among
yourselves. Because there is a limited amount of
disk space available there will be a limit on the
size and number of files you can put in your work
area. Also the files in your work area will be
deleted after 24 hours. Due to security issues that
we are not prepared to deal with, we will NOT provide
a "public" area for the uploading/downloading of
files at this time.

3) The ability to have your mail sent to another address.
For those of you that have accounts on another system
on Campus or on the Internet, you can have your Freenet
mail sent to you there.

4) The ability to create private mailing lists.
You will be able to create your own list of mail aliases
so that you can mail to groups of people easily.

5) Minor additions to the news reader:
o Search and backwards scrolling within news articles.
o Marking articles as unread.

6) Improved Help files.

7) Database feature

8) SIG Directories installed

Synchro Express
Review by Scotty Meredith
(C) 1990

I have owned an Atari ST for several years now. When the ST
first came out, I heard how powerful it was. This machine can do
it all! I saw the graphics, sound and all the other features that
the original eight bit system could not match. After getting the
system home, Unpacking it, and putting it all together, I was
ready to "Unleash the power" of this fantastic machine. After
buying some software to take advantage of the features, I ran in
to a problem. There was no real disk copier that would back up
these valued gems. How could this be??!! The eight bit line has
a happy drive to copy ANY disk, and this new machine with all it's
power does not? "It will only be a matter of time" I said to
myself. "Surely with all that memory and power they will have
something"! Finally, a program called ProCopy came along.
ProCopy was fine, but with new software titles came new
protection, witch lead to new ProCopy's. Soon there were a dozen
versions of ProCopy. Another problem was, when you bought an older
title (Don't laugh, I just bought Infocomm's The Witness last
week!!) you would have to try each version of ProCopy until you
found which version copied it. Contrary to popular belief, the
latest version of ProCopy will not copy every title that older
versions would. Micro League Baseball is another problem. I am
not giving a course on how to pirate software, but Micro League

Sport's Association has a really good method of copy protection. Before you ask, YES, I OWN THE ORIGINAL! I still have not sent my warranty card in..... But I do have a store-bought original. If you copy the disk, and load the copy, it works! or does it? Sometimes you can make it through a complete game with no problems, other times (95% of the time) you are'nt as lucky. Mid-way through the game, the scoreboard will say "WXYZZZ DOES NOT WORK!" and the players will run out of the stadium, out in to left field. It is disappointing to be throwing a no-hitter in the bottom of the ninth, and never know what would have happened.

Then a friend introduced me to SEX. No, not the kind that teenage girls are discovering at a younger age, but SEX on the computer. How can you have Sex on a computer? The average male weighs 200 lbs. and the average female 120. That is 320 lbs!! Can the ST support all that weight??!! The fact is, I have had SEX on my computer for a couple of month's now, and it has never ran better! Even a backup copy of Micro League Baseball works! Ok, before I get the parent's of America sending me nasty letters, let me explain. SEX is short for Synchro EXpress. A new disk copier from Coast to Coast Technologies. The package comes with a disk, and a over-sized printer connector with a disk drive socket and a tail with a disk drive plug on it. I have heard of a similar device called the BLITZ cable, that you can make yourself. I cant bring myself around to believe that a disk copier that claims to copy it all, would be free (except for parts). I have had bad dreams about BLITZ, actually being a hardware virus. THIS IS NOT A FACT OR AN OPINION, IT IS ONLY A DREAM. I am not saying it is or is not, I just cant figure out, why someone would develop a product as wonderful as this, and release it for free. Getting back to SEX (sorry), Synchro Express. This is the disk copier I have been waiting for. I have only ran across one program that it would not back up. That being GUNSHIP. I don't know why, but I could not copy it. I even tried twice. but it DID copy dozens of other programs. The real advantage to SEX, is it does it FAST! A single sided disk is copied in 22 seconds. A double sided in 44. The destination disk does not even have to be formatted! I have two Indus disk drive's on my system, and it was something to see both track indicator meters displaying the same number all the way through the entire copy. As i Said, Synchro Express plugs in to both the printer and disk drive port of your ST. If you are one of the poor souls (like myself) that have the old 520, there is a problem. You plug Synchro in to the printer port, but the drive connector plugs in to the back of your second disk drive. In other words, you leave drive A plugged in to the back of your ST, Synchro plugs in to the back of drive A, and drive B plugs in to the back of Synchro. You have to set drive A on top of your computer (by the function keys). Since I do not make daily back-ups, I can live with this small inconvenience. If you have any other model ST, you have a relatively easy setup. The one problem

I was disappointed to find out is, You can not leave Synchro connected. You will not be able to access drive B. If you do not use drive B for anything, you can leave it connected, but I have other uses for my second drive. All in all, Synchro is a great product. It works as advertised. Also included on the disk is a program to format your disk's to load quicker. I personally have not tested it. I am happy with the standard TOS format. If you have any questions on Synchro Express, you can write me at Internet: AA519@Cleveland.Freenet.edu.

A recession/depression will Atari survive?
By Len Stys

Ok, everyone? Ready for a recess? Oh, don't get depressed on me just because our economy is falling flat on its face! Atari's stock this Thursday dropped to an all time low of $2.50 a share! That is certainly one way to end a companies future in a country. But if I was Atari, I wouldn't get depressed over this just yet. You see, in playing the stock game, there are two pretty safe type of companies to invest in during a depression and that is a toy company and a candy company. The reason for this is because parents are usually willing to give up something that they want for what their children want even during a depression out of love. And children usually want candy and toys... And Atari does make an incredible toy but the question remains! Do parents love their children enough to dish out $179.95 on a video game unit especially when $179.95 will look like $1079.95 during the depression?? We'll have to see. But that certainly isn't my main hope for Atari! My main hope for Atari is the fact that they sell actual Macintosh and IBM look alikes (but are better of course) for about 2-3x less! Will a company buy one Macintosh or three STes during a depression especially when both do the same thing??? Will a company buy one IBM or three STes during a depression especially when both do the same thing? Or even 2 STes with IBM and Mac emulation? Atari can make money out of this depression if they play their cards right. During a depression, you play by different rules and Atari better be finding out what those will be.

****

Two different versions of the same machine?

Two interesting things that were found out during the Mini-Expo that may be of interest to you. The first thing is that the STe was running the software version of PC-Ditto with about the speed of a regular IBM PC/XT! Yes, the new STe has speed and it has power. The only other thing that needed to give it some help was a program called Quick ST II by Branch Software. Who needs any PC hardware emulation with the new STe???
The next little fact that is "seemingly" the case and we have reason to believe is true is that there were two versions of the STe released. One version seems to have major compatible problems, DMA problems, and anything else that you can think of. This version may have been sold to some Atari dealers for a special low price since it is a bugged up version.

The dealer then sells it to you for an amazingly low price (around $600) and you end up with a buggy computer while the dealers blame Atari. However, there is a fix disk you can get seperately which can help it with the software incompatible problem but the DMA problem still exists. The other version is a good version in which is being sold by Atari at a higher price tag (for around $700). This version seems to have no DMA problem and with the fix disk, no software compatible problem. We put the STes through the test at the Mini-Expo and it ran EVERY SINGLE TITLE! Believe it or not! So if you are thinking about buying an STe then you may want to (A) Bring a whole bunch of ST software and hardware with you to test on the machine. (B) Ask your dealer if he/she has found any problems with the machine. (C) Make sure the price tag isn't too low unless you have tested the machine out yourself and find nothing wrong with it. (D) Check with all Atari dealers' STes in your community to make sure you are getting the same computer from wherever you might buy it. (E) Do all the above- my best advice.

Atari still hasn't confirmed if they will indeed replace all TOS 1.6 chips with TOS 1.62 so you will not need the fix disk.

If you are an Atari dealer and have a buggy STe and figured all were alike then you might want to look into the fact that people are claiming bug free DMA STes and find out exactly what is going on.

****

The Children of War
Constructed by Mark Leair from
information provided by Joyce Brabner

Every two years since 1984 young people from countries like South Africa, Isreal, Palestine, Cambodia, El Salvadore, Northern Ireland, and the U.S. get together to tour several American cities, and talk about what it's like to live in a war zone. This year's tour also included environmental disaster areas -- three Russian teenagers from Chernobyl, and kids caught up with the cycle of gang violence, from places like East L.A. and South Boston. (Why? Anywhere kids are being shot in the streets is considered a war zone.)

What happened? Young people who have seen family or friends killed, who have themselves survived torture, or been imprisoned, who have had to flee their countries and start over as refugees, got the chance to ask other young people in the U.S. for help waging peace. They also formed very close friendships with each other during the tour.

These friendships are very important. Someone from El Salvador, who lost family to death squads knows what it's like for a Cambodian teenager to live with memories of "the killing fields." A teenager of Palestinian student's hurt, when classmates make fun of the "terrorists!". An inner city gang member got his head put on straight after hanging out with two South African teenagers.

What are we doing. Well, since the Children of War tours ever two years, many children are far away from these friendships they have established, and many times are back in the war zones that they have grown up in. To many of

these children, a simple phone call is affordably impossible, and a simple letter either takes too long, or never is received by the addressee. In an effort to allow these friendships to continue, a very small group of people in Cleveland, which include members of the Cleveland Atari Information Network (C.A.I.N.) that runs the Atari SIG on Free-Net are putting together small-inexpensive Atari computer systems for these children to hook themselves into Peace*Net. Peace*Net is an international nonprofit computer system that people from all over the world can access from their homes via a telephone modem hook-up on their personal computers.

How can you help? In order to subsidize the cost of these computer systems we are asking for donations. This can be in many forms. A cash donation of any amount can be mailed to the Children of War Project P.O. Box 21815 Cleveland, Oh 44121. Checks and mail-orders can be made payable to the Children of War. Lastly, any computer hardware donation will be considered. If you have any computer equipment (preferably Atari equipment, but other computer hardware will be considered) that you would like to donate you can send us a list to the address above or the Atari SIG telecommunication address located at the beginning of this newsletter. Please be sure to include your name, address, and telephone number. Donations are tax-deductable! Write to the above address for further details.

The Jin GOLDENImage Mouse
Review by Kevin Steele
(Reprinted from the NOAH Newsnotes by author)

Mouse reviews have got to be some of the most subjective reviews in the computing community. I mean, if the mouse works as advertised, what else is left for the reviewer to comment on besides how the mouse "felt" during use? The mouse used by your ST is, by design, the main interface between you and your computer. How it feels when you use it can make a major difference in how well you "interface" with your computer.

Ideally, the mouse should be "invisible" during use--that is, you should be able to concentrate on using the computer, and not be concerned with how you are handling the mouse. "pointing and clicking" with your mouse should be simple, intuitive, and almost second nature.OK^?

Which mouse design appeals to you depends on what you hold to be important in a mouse. Since this is going to be a very subjective review, let me fill you in on what I find important in a mouse.

First, the mouse should fit well in my hands. I like a smooth, sculpted design. Second, the buttons should be large (so I can hit them without feeling around for them), easy-to-click (I hate having to really push down a mouse button), and should have a solid, positive "click" feel when they are pressed (so when the computer doesn't respond to your double-clicks, you know it's the computer's fault and not yours). Third, the mouse should have a high tracking resolution. In simple english, this means that the mouse should be capable of tracking even very minute movements. It should

also mean that the on-screen mouse cursor moves all the way across the screen without having to lift the mouse and reposition it on the mouse pad.

The Jin Golden Image mouse fits all of these requirements, and also just so happens to be one stylish-looking piece of hardware. The mouse sports a zippy 280 dpi tracking resolution, meaning that very little movement is needed to send the cursor soaring across the screen. After the sluggish Atari mouse this may seem a bit hard to control, but after a week or so of using the Jin mouse, you'll find the Atari mouse unbearably lethargic. Unfortunately, the Jin mouse does not have a very high tracking speed, meaning that you may find the mouse cursor occasionally "going crazy" when you move the mouse too fast. (This problem is easily fixed by installing the Public Domain MACCELL2 mouse accelerator program, at the slow setting, into your AUTO folder.)

The Jin mouse has very light, responsive mouse buttons with large tops. These buttons have a nice, solid click, making double-clicking a breeze. A six-foot cord was a bit much for my needs, however. The mouse doesn't come with any instruction manual (some would ask if a manual is even needed), but the Jin mouse does come with its own mouse pad, a small smooth-surfaced pad that I found let the mouse glide over it like a wet icecube.

As you can tell, I've become rather enamored of the Jin GoldenIMAGE mouse. I'm not going to try and justify my feelings, as they are just that--feelings. I'd recommend you play around with this mouse a bit before you buy one. I'm fairly certain you'll like it, and since it retails for the same price as the Atari mouse ($49.95), it makes a wonderful replacement if your Atari mouse should ever scurry off to rodent heaven...

1577. Gemini, AMCGDOS and GDOS Problelms (was Problem due to AMCGDOS)

Newsgroup: comp.sys.atari.st
Date: 1990-09-02 15:24:44 UTC
From: D.C.Halliday@newcastle.ac.uk
Message-ID: <1990Sep2.152444.19431@newcastle.ac.uk>
Source record: 238948

In article <1990Sep1.141312.16944@cs.dal.ca> silvert@cs.dal.ca (Bill Silvert) writes:
>I recently posted a problem about damaged menu appearances in VIP
>Professional. The problem turns out to be due to loading AMCGDOS.PRG in
>my AUTO folder -- no AMCGDOS, no problem.
>
>I did verify that the VIP was not damaged -- running from the original
>disk (write-protected of course) showed the same problem.
>
>Also, ALTBOOT did not work with AMCGDOS installed -- I though ALTBOOT
>came first, but I will have to check. I'd hate to have to choose
>between VIP and Gemini!

I to am having problems with AMCGDOS and GDOS. If I boot my system
with AMCGDOS then GEMINI works fine but other applications such as
TIMEWORKS moan about not being able to find font files after rebooting
with their assign.sys. If I use GDOS 1.1 all my applications work fine
but when booting with gemini's assign.sys all the additional fonts
gemini.fnt,courier.fnt,... apear as garbage.

Has anybody got any ideas? I thought AMCGDOS and GDOS where supposed
to be compatible. Would G++ solve the problem?

Message-ID: <1990Sep2.193428.13722@doe.utoronto.ca>
Source record: 238949

I posted a message to this effect before, but then our system died and we lost news for a couple of weeks. I have the gcc 1.37 release from Terminator. I love it, but I cannot get the preprocessor to work correctly under MT CShell (it will send output to stdout, but not to a file). Before our machine died, I had managed to get the entire source code from Terminator. It took over a week to order the source piecemeal, and it is all gone now with the crash. In any case, I could make little sense of it.

Could someone send me the ACTUAL SOURCE, #ifdef's and all, used to create the gnu preprocessor, so I can find and fix the problem? Thanks. Dave Beckemeyer has already fixed the only problem I could find in RTX, so I do not know what could be causing this problem. I will inform D.B. when I find the cause.

1580. media change detection problems (was: Wanted: Chinon Floppy Drive Horror Stories)

Newsgroup: comp.sys.atari.st
Date: 1990-09-02 22:06:30 UTC
From: pierrot@tubopal.UUCP
Message-ID: <1738@troll.tubopal.UUCP>
Source record: 238953

Atari used to modify their built-in Chinon drives so that a media change
would be detected. A number of external floppy drives from `third party
vendors` and, as it seems to me from the `Wanted: Chinon Floppy Drive Horror Stories`
articles, some newer atari drives don't make that distinction.

One, rather boresome way to work around this problem is to change the state
of the write protect -thus forcing a media change.
Those who don't like the "disk out, toggle write protect, disk in,
disk out, toggle, disk in" method could do a little modification
to their drive. (or have their dealer do it)

It should be possible to use the eject button to simulate that change of the
write protect status by hardware.
I didn't try that yet, so I can't give you any specification on how to do the
job exactly, but it shouldn't put anyone with a minimum of hardware experience
to major problems.

> (cs63bld@unccvax.uucp)

Actually, a better solution would be an upgrade to the latest version
of HDX (currently 3.02) and the latest TOS, TOS 1.4.

This would make your hard drive MUCH faster and is much more reliable
than fatspeed.

As soon as more information is available I will pass it along. Rest assured, we are aware of the importance of networking in the relation to the use of our machines in the business workplace. We also recognize the important of the Ethernet standard.

All I can really say at this point is that we are working on it. As soon as we have something, we will let you know!

HiSoft C Interpreter has some strange features (and some bugs too!).
One of the most strange and disagreable feature is that you can only
examine extern variables. The interpreter is absolutely blind about
automatic variables.

IMHO I would say that Aztec C with sdb (Aztec C source level debugger)
or Mark Williams C with csd (MW debugger), are mutch better
choices.

GDOS and G++ have a strange feature!! They ignore the Motorola format flag. So all fonts must be in Intel (yaghh!) format (bytes are swapped in each word).

To use the gemini.fnt,... with GDOS, you mus convert it to the Intel format...

1592. ZX81 Emulator (Continued)

Newsgroup: comp.sys.atari.st
Date: 1990-09-03 13:06:08 UTC
From: gary@brb.isnet.inmos.co.uk
Message-ID: <143.26e25541@brb.isnet.inmos.co.uk>
Source record: 238962

There seems to have been quite a bit of interest in the ZX81 emulator mentioned in my last post. I was away from work for the week and a half following the post, and as our system only keeps messages for a few days, I may have missed any messages posted to the net. I was pleased however to read the messages that were emailed to me. I will try and answer them as soon as possible.

A number of people have requested that I send a copy of the program (you masochists). I will be happy to oblige, but I need to check about the copyright situation. The emulator must hold a copy of the ZX81 ROM, and the programs supplied were originally commercial. I was shown the program by a friend, so I will have to get a copy from him first.

I will then try to figure out the best way to get a copy over to the US.

This is just a quick message, watch out for further postings.

1593. An article on accessing Free-Net through Internet

Newsgroup: comp.sys.atari.st
Date: 1990-09-03 15:57:57 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1990Sep3.155757.18814@usenet.ins.cwru.edu>
Source record: 238963

I have been getting a lot of responses to my posting about the Atari SIG on Free-Net and many of you want to know exactly how to do it or what Free-Net really is about. So I dug out this article from Z*Net which explains more about it:

```
////// // // ////// //////
// \/ /// // // //
// /// // // // ////// //
// /\ // /// // //
////// // // /////// //
```

```

==============================
CLEVELAND FREENET - FEEDBACK
==============================
by Francisco X DeJesus
```

About two months ago I read about the Cleveland Free-Net right here in Z*Net. You've probably heard something about it by now, including the fact it's absolutely free. However, if you live nowhere near Cleveland, you may be thinking how you can get to it without a not-so-free long distance phone call. All you really need is access to a computer system in the Internet network...

If your'e at college, the best way to connect to it is to use your ST as a terminal to a local computer system, for example, using Uniterm to call your campus computer system. Most colleges and universities nationwide have Internet access. If you have an account in that computer, log in as you usually would. From your system, it is a one-step process to get to the Free-Net. Type in:
"telnet freenet-in-a.cwru.edu" (no quotation marks). If it doesn't recognize the hostname, try using the IP number directly:
"telnet 129.22.8.76". Most mainframe operating systems (VMS, Unix, CMS, Music, etc.) support the Telnet command.

If you do not have an account on the local computer system, ask around to see if you may request a temporary account or if there is a 'guest' account available. Also ask about the kind of computer that answers the phone calls. If it is what is known as a 'terminal server', you have to connect from there to the actual computer that you want to use (for example, you type in something like 'connect LOCALCOMP' and then your'e asked for your username and password to log in). If this is the case, some terminal servers will allow you to use the Internet directly: type in "connect 129.22.8.76". A last resort is to visit some of the local microcomputer labs in your school. Find out if they are plugged into your campus network (usually thru ethernet). If they are, you may obtain PD Telnet software for both Macs and PCs.

Once you reach the Free-Net (it takes just a few seconds to connect from anywhere in the country) you will be greeted by the title screen and an ASCII pic of the 'electronic city'. You may log in as a guest user and begin to explore the system or apply for an account (they will send you the actual application by mail). As a guest user you can go anywhere and read anything in the system, but you can't leave messages, e-mail, or chat with the other users online.

The whole Free-Net is set up like a menu-driven BBS with a city motif, and well deserved since it is HUGE! The system is extremely easy to use, and online help is available. Do check out all the SIGs, especially the Atari SIG (type "go atari" at any arrow prompt). The Atari SIG is among the largest, and (as usual) Atari users are among the most outspoken in some of the other areas. Not all SIGs are computer-oriented, and there is more than one SIG for every interest (for a complete listing of the SIGs check out the Index under the Post Office's User Services).

In all, if you have the chance, I highly recommend you try out the Cleveland Free-Net. As a first impression, the Free-Net works like any small BBS, but on such a large scale that the sheer magnitude of it still awes me (how many BBS's do you know with 96MB RAM and over 2 gig HD space? - and it's growing!). It takes very little time to feel at home there, and it's free, so go online today!

1594. UNIX windows for System V

Newsgroup: comp.sys.atari.st
Date: 1990-09-03 17:13:40 UTC
From: darius@edm.isac.CA
Message-ID: <1990Sep3.171340.19210@edm.isac.CA>
Source record: 238964
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st,comp.os.minix

Hello all,

I recall reading some time ago, on one of these newsgroups, that someone had gotten the host (UNIX) part of UNIX windows to run under system V, instead of Berkeley UNIX. I recall that the person who posted also said he would be willing to send the diffs for his version.

Well, I'm interested. Whoever it was (sorry, I've forgotten your name and I didn't save the article) could you either get in touch with me via email, or post to comp.sys.atari.st.tech if you feel there is enough interest in this?

Thanks very much in advance,
Darius

PS: if you do try to email me, use the address "darius%isagate.uucp@uunet.uu.net", as most sites don't seem to know about our new address yet.

The other important thing to menton about the fixed rate for GEnie
(a mere $4.95US as J Townsend mentioned) is that they've dropped the 2400
bad charges by almost 1/2. Down to $6.00US /hr. I figure on a net savings of
of about $10.00US /month at my present GEnie usage.

Oh, WOW! I'm not sure what to make of this. I guess I should say "I'll
believe it when I see it," but, just in case, could someone answer a couple
of questions for me?

(1) What is the max resolution for a monitor for a TT?

(2) Would a Mac external SCSI drive attach to the Atari's SCSI (For shame, I
got sick of waiting for the TT a year ago and bought an SE/30..) ?

I can see it now... In another year I could buy a (32 MHz?) TT with unix (BSD
extensions?), X11R4, _and_ Ethernet. I think I'm going to faint! I *know*
it's premature, but I want to believe it *so* bad!

I've been trying to reach Gribnif Software at GRIBNIF@Umass.BITNET, the address on their latest newsletter, and I get a Host unknown error. Can someone please tell me what I'm doing wrong? Or am I just out of luck? Thanks!

1601. Re: ACID2 problems

Newsgroup: comp.sys.atari.st
Date: 1990-09-03 20:36:35 UTC
From: ekrimen@csuchico.edu
Message-ID: <1990Sep03.203635.20779@ecst.csuchico.edu>
Source record: 238971

I'll answer my own question about getting the Acid2 demo to work.

I wrote out a nice long message detailing how I figured out how to get it to work, and then I deleted it. Argh! So you'll get the abbreviated version. :^)

You must change the scan rate to 50Hz to get it to work. I loaded BoingSTe, quit it, and then loaded Acid2.

Is there any chance of damaging the monitor when changing the scan rate from 60Hz to 50Hz?

1603. Need help on The Pawn

Newsgroup: comp.sys.atari.st
Date: 1990-09-04 05:42:34 UTC
From: bwhite@oucsace.cs.ohiou.edu
Message-ID: <1858@oucsace.cs.OHIOU.EDU>
Source record: 238973

Well, after a lot of putting off, I finally decided to go back
and give The Pawn another shot. I'm stuck, as usual, and have a few
questions that I hope someone can answer. Please answer by email, my
address is: bwhite@oucsace.cs.ohiou.edu

I'd prefer hints over outright solutions.

1. Is there any real use for the following (yes or no):
- the marijuana plant
- the limbecks in the laboratory
- the flasks in the laboratory
- the wheelbarrow
- the teapot
- the carrot
2. Any hints on how to get past the dragon?
3. How about the demons in hell? (ie, how to get past them)
4. Should I just ignore Jerry Lee Lewis?
5. Is it OK to just let the princess go, or is she needed for
something (i.e., should I tie her to me or something)?
6. Should I have *anything* to do with Kronos at all? (should
I get the note from him; should I deliver it; should I
kill the adventurer, etc)

A lot of these I could figure out myself eventually, but I'd rather not
go through the tedium of finding out near the end of the game that the
flasks I dropped and broke were of value.

In article <38514@shemp.CS.UCLA.EDU> stephen@oahu.cs.ucla.edu (Steve Whitney) writes:
[actually accurate information deleted]
>As I understand it (if I'm wrong, send me _MAIL_ and I'll correct myself),
>the Amiga A3000 25MHz version still runs with a 16MHz memory system as well.
>
>Have fun!
>
> --Steve

As promised, I am correcting myself. Several people sent me mail to the effect
that the A3000 25MHz version does indeed have as faster memory system than
the 16MHz version, and that is the reason that they cannot be upgraded. I'll
do some research on my own as to how it works exactly and post later, but
I do wish to retract my erroneous statement now.

Howzat?

Try setting ESHELL to be "/dev/c/gnu/gulam405/gulam.prg" instead.
GNU-Emacs uses Unix style pathnames (/) instead of Atari style pathnames (\),
and also 'fiddles' changing drives with '/dev/n' instead of 'n:'

Get TOS 1.4. This is the chief user-visible improvement in TOS 1.4
over previous TOSes. Another of the improvements will help, too:
adding enough memory to the sector cache (with CACHEnnn, for example)
to hold all the FAT and root directory sectors on all your disks. That
way your disk won't constantly be reading the same stuff (the FATs) for
every file: it'll already be in memory.

Posting this for a friend:

I have an Atari 1040, no memory expansion and think of buying the
Spectre board for running Mac software. I have some questions:

Where can I buy it cheapest by mail order (and with credit card)?
Is 1 M memory enough or do I have to expand it? Where do I get
cheap memory upgrades?
What system software can it run?
Any incompatibility problems with programs that can run on a SE?

Appreciate any comments

Sincerely,
Chris Loneberg

1613. Finally! New Water-resistant Ink for DeskJet Printers!!

Newsgroup: comp.sys.atari.st
Date: 1990-09-04 18:23:17 UTC
From: close@lunch.wpd.sgi.com
Message-ID: <1990Sep4.182317.22498@relay.wpd.sgi.com>
Source record: 238990

The new HP DeskJet 500 printer replaced HP DeskJets and DeskJet Plus printers today (Sept. 4). The old DJ printers are no longer being manufactured by HP, and existing ones will, of course, be fixed if broken.

Like the old DJ+, the DJ 500 produces up to three pages of text per minute and up to two pages of graphics per minute at 300-dpi resolution. However, the new DJ 500 is actually 3% to 10% faster at producing graphics thanks to an improved microprocessor chip.

The DJ 500 comes with two new resident fonts (CG Times and Letter Gothic according to a company spokesperson) and improved font spacing overall. Several new font cartridges have been created for the DJ 500.

BEST OF ALL, the DJ 500 has a new non-smearing ink! This new ink is resistant to highlighter. It's also resistant to repeated paper handling. It's resistance improves over time, as well! Note that no special paper is required. The DJ 500 uses plain paper just like all the rest of the DJ family of printers.

These new ink cartridges will be available to all DeskJet family and DeskWriter printer owners in November, when the current supply of old cartridges is expected to run out. These new cartridges are REPLACING the old ones, so no modifications are needed to older DeskJet and DeskWriter printers in order to use the new water-resistant cartridges.

The HP DeskJet 500 printer lists for $729 and the new water-resistant ink cartridges will list for $19.95. Call 800/752-0900 if you have any more questions.

1614. How to read sectors in GFA Basic?

Newsgroup: comp.sys.atari.st
Date: 1990-09-04 18:42:52 UTC
From: SONORAN@tecmtyvm.mty.itesm.mx
Message-ID: <90247.124252SONORAN@tecmtyvm.mty.itesm.mx>
Source record: 238986

I am still trying to recover the files I lost due to corruption of the first directory sector. Unfortunately, none of the sector editors will read sectors and write them to a file, they just copy sectors (to the same location). So it seems that I will need to do a little proogramming. Alas, I can't speak C! :-) (I will learn, someday, honest...).
In the book "Presenting the Atari ST" from Abacus, it says that there is a XBIOS function (number 8) that "Read diskette sector. This function reads one or more sectors from the diskette." As GFA Basic (2.0) can make XBIOS calls, can anybody tell me what are the parameters and correct usage of this call? Thanx in advance!

From: cs63bld@unccvax.uncc.edu
Message-ID: <2663@unccvax.uncc.edu>
Source record: 238988

I have a 1040ST with an ICD HD controller/battery backup clock board.
I am using ICD's non-resident timesetter program and I also have TIMEDRV3
on my system (the corner clock that shows drive access).

Here's the strange part:
After system bootup, the TIMEDRV3 clock shows the correct time, but the time
shown by FLASH, the Control Panel, and that the system writes to files is about
30 seconds behind.

If I reset the clock through the control panel, run the time program to update
the battery backup clock, and reboot, the same situation occurs!

What's going on here?!

Thanks in advance,
Brian

Then those of us who do run TeX on our STs loose out. May I
suggest that you stache away a copy of dvi2tty (from
sun.soe.clarkson.edu ?) to make an ASCII version of the raw dvi
files? Or just get showdvi.zoo from the atari archives then you
can enjoy the typeset text without the TeX software.

In article <1990Sep2.193428.13722@doe.utoronto.ca> david@doe.utoronto.ca (David Megginson) talks about problems using Gnu C with RTX / MT C-Shell.

J.R. Bammi has found and fixed one problem related to the GGC startup and RTX (and Mint etc.). He sent me a new crt0.c file which corrects the problem, and he told me that the current version of GCC on terminator has the fix. What's required is to re-compile the runtime code with the new crt0.c.

If anyone wants this new crt0.c, I can mail it to you. It's also available on the BDT BBS at (415) 530-9682.

1619. Is there a window patch for TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1990-09-05 01:40:49 UTC
From: n8742883@unicorn.WWU.EDU
Message-ID: <1491@unicorn.WWU.EDU>
Source record: 238992

Hi, all!

I installed my TOS 1.4 last week, and have been slightly
bothered with a small bug with repsect to the window slide bars.

In TOS 1.0, if I cliked the shadowed area to the side of a
window's slide bar, the window would "jump" one windowfull of
text/graphics/whatever in the proper direction. With TOS 1.4, I have
noticed that in two of my programs (EMPIRE and ST-TALK Pro), clicking
the grey area on window's bar sends signals to the program that the
grey area has been clicked TWICE and overshoots the area which I want
to view. If I position the slider manually (click-drag-release) the
bar (and the windo info) adjust to the correct place. Is there a fix
for this window problem?

And one last question from a TOS 1.4 neophyte: What is the
name of the program that allows the right hand button to drag and MOVE
files on the desktop on atari@archive?

Thanx in advance (as always... :-)

> Only something to VIEW TeX files.
>
> What and WHERE can I get them?

TeX files are just ASCII files, and you should be able to look at them with most file viewers. The most common problem seems to be with .TeX files created on a Unix-like system, with linefeeds terminating lines instead of a linefeed/return pair. I know this freaks out the vanilla Atari file viewer.

To solve this there are a couple of ways to go. One of the Unix-type editors (e.g. EMACS, STEVIE, etc. ... I use GNOME for this) can handle these files. You can view them within the editor; you can also save them in ST native format so that the desktop can handle them gracefully.

I don't recall if DCSHOWIT can handle them, but you could try it out and see. The TEMPUS demo from atari.archive might also be worth a shot.

Hope this helps.

Max J.

Everyting I have that came with docs in TeX format cam with the .TEX file,
so doesnt that have to be run through TeX to create the Dvi file?
If so, how about people including the DVI file as the doc.

- I installed my TOS 1.4 last week, and have been slightly
- bothered with a small bug with repsect to the window slide bars.

The 'bug' you described is a feature for the rest of us -- or me at least. :^) It displays the responsiveness of the mouse and Rainbow TOS, if I may be so eloquent. :^) Perhaps adjusting the mouse-click response via a control panel would alleviate the problem. Or make it a habit to click on the arrows instead of the slide bar.

- And one last question from a TOS 1.4 neophyte: What is the name of
- the program that allows the right hand button to drag and MOVE files
- on the desktop on atari@archive?

RT_MOVE. Pick up the RAINBOW utilities from there if you haven't already. I especially like MACCEL2. Good job, Ken!

From: ritchie@hpdmd48.boi.hp.com
Message-ID: <15480008@hpdmd48.boi.hp.com>
Source record: 238858

The new Genie fee is a flat rate with no connect charges during access to the Star*Services areas. These include

- e-mail (which *may* file transfer between users)
- wire service
- several financial based services (Schwab, real estate related, etc.)
- Groliers Encyclopedia
- single user games including 550 point Adventure and several other Adventure games
- all the hobby related BB's (N.B. this does not include computer related BB's).
- closing stock quotes
- Offical Airline Guide
- EAASY SABRE - see what flights are available when
- Jerry Pournelle (ok, maybe they should pay you $4.95 a month instead :^)

You are probably wondering what isn't covered in the $4.95. I will quote from GE's press release:

"The rate for U.S. access to those GEnie serve products/services not covered under the flat rate -- such as all personal computing BB's , all software libraries, financial services, chat lines and real time conferences, Computer Assisted Learning Center (CALC), and multiplayer games -- have been set at $6/hr for all three access speeds (300/1200/2400)."

Canadian rates at C$5.95 and C$8/hr. The signup fee is currently being waived.

The 2400 baud rates have dropped to $6/hr also. I suspect that Prodigy is giving them fits. It does seem that the services are ones that are probably not too popular. I will probably try it for the 1st month anyway.

- Dave Ritchie

1627. SIMMS, 6888#s - STe

Newsgroup: comp.sys.atari.st

From: dav@eleazar.dartmouth.edu
Message-ID: <24052@dartvax.Dartmouth.EDU>
Source record: 238987

I ordered my 1040STe today!!! and I plan on popping in memory as soon as it gets here. I beleave that standard 1 Meg x 8 SIMMS will pop into the machine and you have at most 4 banks of them. Does the 1040STe generally come with 4 banks of 256K memory chips or does it have one bank of 1 Meg chips? i.e. do I have to order 4 megs of chips or only 3? Do I have to wait and see?

The STe can't take the 4 Meg chips right? (Do 4 Meg chips have more pins?)

Anybody have an idea where to get a 68881 or 68882? The magazines I flipped through (Byte, Comp Buyer's guide, STart) didn't have a single listing. What are the different FP chips that work with the STe and how much do they help with intense double precision calculations?

While I was looking through the mags for SIMM prices I also looked at the prices for 2400 Baud modems with MNP 5. Every place that had them for under $175 was sold out. Anyone know of a place to get one?

While I am asking questions.... Whats the latest version of Mark Williams C? Does it work on the STe? Does the Spector GCR work on it?

1628. How to connect a Priam V185A ??

> --Gerry

My reading of the GEnie offer is that you -do- have a choice. If you prefer to pay for connect time to the services offered at the relatively low fee, you are most welcome to do so.

Likewise with Delphi. Their 20/20 plan appears to be quite nice for those of us who were paying lots of $ for connect time, and on-line charges for those who don't use the system that often is reflected in that structure.

The idea is to have a -steady- source of income, regardless of whether that income might sometimes be lower than peak usage in the past. You can plan budgets with a steady income; you can plan nothing if you get paid by the hour and are 'employed' on a relatively intermittent schedule. (Which is what the current system was like for the on-line services).

>poster did not mention. I think it is a GOOD DEAL. Besides, GEnie is going to
>lower 2400 baud rates as well. Shows me for making decisions based on
>whining in comp.sys.atari!
> % Andy Cassino %
> % Hewlett-Packard - Lake Stevens Instrument Division %
Well, when I first mentioned this situation, I did mention
that Genie's deal looked the best; however, my main assertion
still stands, i.e. people who use Genie infrequently will be
subsidizing the cost to those who use if frequently. With
respect to John Townsend's message: what if you don't use
mail on Genie? and what if you only access Genie once every 4
months, say? As for Andy Cassino's comments: what if you
don't have 2400 baud?
Let's look at this another way? Would Genie be switching
formats if it would be worse for Genie?...I doubt it, so it
must be better for them. They claim it will be better for the
users as well, i.e. the users will spend less money (in the
long run). If the users will be spending less money, this
should be worse for Genie (I would think). Well, somebody has
got to be paying more...who? Exactly the people who would be
paying a monthly fee, but would only be using the service a
bit every few months. To tell the truth, I don't think I've
used $60 of connect time each year for the past few
years...and I imagine the same is true with others.
I guess I don't see why none of these services (i.e. CIS,
Delphi, or Genie) has offered the users the option to choose
one option or the other, i.e. join the new system, or stay on
the old way. It seems to me that would make everyone happy.

The scheme used by PC Ditto to clamp the header on the 68000 chip is awful.

SOLDER it to the 68000. This is not trivial, but is necessary for consistent
performance. I used a Weller constant temp iron with a very long tip.

Also, Don't forget the jumper on the Math Chip socket of the PCD II board.
It absolutely necessary.

OU acs has the scanner hooked up this semester. I have started using it.
I was wondering what would be the best method for converting scanned images to st format? I can save the scans in the form of pict (two formats - paint & I forget the other) or TIFF. I can also convert it to various other formats including GIF and standard mac bitmap (color scans have a few other formats that I can convert to as well)
What software do I need, and what formats should I go to for the software?
BTW the scanning accessory is Microtek

|> for this window problem?

You should consider this a feature rather than a bug. Slider events (or how else they might be called) are sent as long as the mouse button is pressed while the pointer is in the grey area. This makes it possible to quickly scroll through a window.

However, you are still right: It is extremly difficult to issue exactly *one* slider event. There really should be a (configurable) delay between the first and following slider events! It should be like with the auto repeat function of the keyboard: If you hold your finger on a character key there is a delay between the first keystroke and subsequent auto repeated ones.

I have noticed this problem in Flash (exact same symptoms) while using
Turbo ST (color monitor). (Apparently Flash is not fully GEM compatible.)
If you are using Turbo ST (or possibly Quick ST ???), try eliminating that
program. (If I remove Turbo ST, the Flash scroll bars return to normal
operation.)

Hello, y'all! I'm kinda new here, so I got a few questions:

1) is there anyone out there programming in assembly on the ST?
2) are there any forums on MC68000 assembly out there?
3) I'm currently writing a program which converts resource files to assembly format... Would anybody be interested in BETA testing it (when it gets done)?

Yes, the new DeskJet Ink cartridges WILL replace the old, smearing cartridges. The old ink cartridges will no longer be sold once the current supply runs out ('cause they aren't being made anymore). Note that the new non-smearing ink cartridges will be released to the general public sometime in November. Right now HP only has enough available to supply one free with each HP DJ 500 that's sold.

1640. A short hard drive spectre gcr story

Newsgroup: comp.sys.atari.st
Date: 1990-09-05 18:46:46 UTC
From: kawakami@ocf.berkeley.edu
Message-ID: <1990Sep5.184646.24554@agate.berkeley.edu>
Source record: 238865

A story about my GCR and hard drive

[Cloyne Court is a university student housing co-op. Spectre is a Mac emulator.]

Two days ago I moved my computer from my old room, in the sunny west wing of Cloyne Court, over to my new room, an almost spacious double in the east wing. I anticipated that I'd move in and debug the program I maintain and call my employer to tell him the good (though overdue) news.

At this point, I should point out that I'm not maintaing ST programs; I've got a Spectre GCR and earn the money in Mac mode. I should also point out that I have a hard drive: a necessity in both mac and ST mode. The ST is pretty remarkable and I appreciate the speed increase: compiles which take 30 minutes on a Mac with a hard drive take only 10 minutes on the ST. But sometimes I wish the Spectre and I had never met.

If we go back into the past about two months you'd see me agonizing over bad writes on a Teac drive. The Teac floppy works fine and fast with regular ST format (aka IBM or Sony format) but it dies all over the place in GCR mode. I had the drive connected to the ST directly: I got the drive at the computer store and I stuck the bare thing into my hard drive case and snaked a cable from it to the ST. I don't know what it was but it refused to write to GCR disks with any accuracy. This all cleared up when I bought a second disk drive. I don't know if it's the mechanism in the external (a BeaST FD Cub: very quiet) or if it's the signal amplifier in that drive or if the GCR is supposed to have a stronger signal or what, but the problem vanished. So did my money. On the other hand, I have two drives; two drives is some unwritten prerequisite for MacUsage. I try to be contemplative and regard this as partial payment for my hacker-like habits of cutting corners and getting away with building a lot of my own hardware.

The other homebuilt thing I have is my hard drive. It's a (cheap) Seagate 157N mounted in a PC case. That PC case has lots of spare room and I'll probably shove a PC mutha' bore in it some day, but until then I have to tell people that it's just my hard drive case (which still impresses lots of students and gives me an artificial ego boost.) Like every thing I own, the drive has given me some heartache. But so far, nothing has topped the nefarious combo of the Spectre WITH the hard drive.

For some reason or other, the Spectre is not very tolerant of semi-flaky hard drives. Errors which the ST cannot detect show up in Mac mode. When I changed rooms, the hard drive got jostled around a lot, but not bumped and banged to the point where I lost any data. But in Mac mode, the machine started crashing and kept on crashing. I figured it was a sick "System" or

something so I thought I'd whip out my backups (thank Ghod for those!) and everything would be hunky dory. Of course, in the process of moving, I'd misplace/lose my most important posessions: Hard drive backups, X-acto knife, plastic space-people figures, and my GCR manual. So I went around posting posters proclaiming "LOST! One box with red diskettes and other stuff. I need this back." The day went by and I was feeling truly bummed out of my video etched brain. I had seen more "system error"s and "bombs" than any one user should be allowed to witness lest she or he be turned off computers for life: all computers Nintendo not excepted. But that evening a miracle occured. The neo-deadhead who moved into my old room found the diskettes and gave them to me. I offered him a beer but he refused; he even told me he made a long distance call on my old account and would pay me for it. For a moment I thought I had seen his Rasta-cap turn into a rainbow halo with Jerry Garcia's head popping out of it. I swear it.

I set my butt down in front of the computer to restore it's health. The same old sequence: load Spectre.prg, re-init the Spectre partitions, reinstall the backups, and finally reboot. So far so good: no disk errors. But before I can say "SCSI-Interface-and-thank-you-jerry" the system bombs. After several repetitions of this song-and-dance I decide to lose my mind. I guess that it's time for a full re-format of the drive. After all, what have I got to lose? My sanity is already gone.

So, to make a long story less long, the re-format fixed everything up.

The End.
-
Remember, if you have a problem with hard disks and the GCR, re-format your hard disk. It's a pain to restore, but there's no other way out.

[> ~ |Mike Whitbeck | mikew@wheeler.wrc.unr.edu |
[
[Everyting I have that came with docs in TeX format cam with the .TEX file,

Not all; Form, for example, only had a dvi file. What a pain!

[so doesnt that have to be run through TeX to create the Dvi file?
[If so, how about people including the DVI file as the doc.
[--
[--
[Frank Rachel | Internet:Dnd15j9z@Umiami.Miami.edu | University Of Miami
[--

But for the more general case if you have the .tex file you have plain ASCII since the formating commands are also plain ASCII in TeX. If the formating commands bother you (they almost all begin with a backslash) they can be stripped out with DETEX (check comp.sources.misc, comp.sources.unix) or any number of filter scripts (used with spell checkers like ispell) writen in awk, sed etc.

To me, this is a far better situation than docs in, say WordPerfect, or similar programs where the formatting is done using non-printing characters and character combinations imbedded in the original text.

There are quite a few word processors out there all with different codes and the commercial ones can be $$$ whereas TeX is FREE and runs on most machines with ~500K memory (Amiga, PC, ST, Macs, unix boxes, VAX, maniframes ......) and for those without TeX the files can still be read since .tex files are ASCII.

BUT PLEASE FOLKS- if using TeX do post the .tex files NOT the .dvi files! It's easier for all concerned to read your documentation!!

I do agree that where feasible ASCII is preferable but where formating is important (figures and equations) some convention is needed. TeX is probably the most universally available free package. However if the material is rather ST specific how about .pi3 or .neo graphic images of the whole doc as a 'standard' presentation?

Is it possible/easy/difficult to write a 'doc.prg' that senses mono/color and displays itself (i.e. imbed the documentation text, images in the program doc.prg as opposed to a doc.txt)? Just an idea.

I can't answer for US sources, but I have Spectre GCR running on a 1 Meg
520 and the 832 Kb that it leaves me is enough for most software,
including Hypercard. I've used several System/Finder combinations,
currently 6.0.4, with no problems (but with only 832K I don't run
MultiFinder).

>David Paschall-Zimbel davidli@simvax.labmed.umn.edu
I'm sorry to say this, David, but your information is not
correct. Your posting gave me pause to think that maybe I was
incorrect in thinking that one HAD to join one of these "pay
per month" plans...so I called both Delphi and Genie today.
As I said...you are wrong...no one will be allowed to continue
their memebership as it has been for so long...you must join
and pay each month! Delphi has two different plans: $20 for
20 of connect time each month, or approximately $6 per month
which gives you one free hour each month and then each
additional hour is also about $6 (this is a reduction from
their current connect charge).
Also, after hearing some people on this net explain that maybe
one would save $$ in the long run, I was beginning to think
that MIGHT be true...until, that is, I read Dave Ritchie's
post (#17464) which states that NO personal computer RT would
be included in the monthly fee. This is probably 98% of my
connect time, if not more. I usually go to the AtariRT or the
GadgetsRT, and that is about it. When I called Genie the
other day, a representative told me that all BBSs would be
included in the monthly charge. When I asked if this included

computer BBSs, he went on to explain that within computer BBSs there are software libraries and regular BBSs...and that while the libraries would not be free, the BBSs would be----------WRONG. Dave Ritchie is correct, I called Genie back today, and this rep confirmed that NO part of any personal computer BBS would be part of the charge.
So, I am grateful to the discussion and discussants on this net so far...but it looks more and more like there is no real reason to stay, just to subsidize the other users.
This leads me back to my suggestion (repeated at the beginning of this message): if the new plans are going to be such a benefit to the users, why not let the users choose which plan is best for them (even if they should choose the "not so good" plan of paying only for what you use).

1645. Mega ST2 for Sale CHEAP!

Newsgroup: comp.sys.atari.st
Date: 1990-09-06 04:36:24 UTC
From: ww0m+@andrew.cmu.edu
Message-ID: <catR98W00WB60_m212@andrew.cmu.edu>
Source record: 238859

Atari Mega ST2 for sale, includes:

- Atari SC1224 Color Monitor
- Magic Sac V5.91 with Epstart (print to Epson printer)
- Epson LX-80 Printer
- Software: Word Perfect, Flash!, PC-Ditto, TDI Modula 2,
68000 Assembler, and more.
- 2+ years of START magazine with disk

Give me an offer. I would get as much use out of a termnal as I do out
of this machine. I really need to sell it. Will sell with or without
the printer.

I will take a huge loss on this machine, I just want the cash.

David Paschall-Zimbel writes:
>My reading of the GEnie offer is that you -do- have a choice. If you prefer
>to pay for connect time to the services offered at the relatively low fee, y
>are most welcome to do so.

This is incorrect. The announcement on GEnie says that you have until
the end of September to join. If you don't agree to be billed the minimum
of $4.95/month by then, your account will be closed, and you will no
longer be allowed to access GEnie at all.

You MUST pay them $4.95 monthly, PLUS the regular $6.00/hr for machine
specific Roundtables, like the ST Roundtable.

Delphi on the other hand gives you a choice of being billed per hour with no
monthly minimum, or paying $20 a month for 20 hours of connect time.

Walking into an Atari only dealer to pick up a 1020 printer (hey, I collect old Atari stuff) I saw this in a corner.

The Atari CD-ROM player that has been held back from release.

Really. I asked about it, and I was told that it is a "teaser", and it wasn't for sale. Unfortunately, I had to make it to San Francisco in less than an hour (this was at 5pm, in Santa Clara) and couldn't try it out. It wasn't running at the time, but it sure seemed interesting. It looks like the pictures, an unassuming unit. Next time I am able to spend more time, I'll try to get a demo or something, and perhaps try one of my CDs on the thing.

Oh, by the way, this was at B&C Computervisions on Kifer Rd.

I have just required an old working Zenith monitor and i was hoping to hook it up to my atari but i seem to be having some probs..

The question i would like to ask is:

The monitor is a Zenith with a connector at the rear similar to an aerial connector you get on TVs so why cant i connect this to my atari thru the TV output socket??

Is there something that has to be modified or will it just not work???

Thanks for any advice,

Donald

What ever happened to the proposed gateway between GEnie and
Usenet?

I might be persuaded to join if the gateway existed so I could
get rid of my Columbia account (which costs me more than $4.95
a month I might add).

Also, I've seen some talk about a service called Delphi. Is this
any good? How does it compare to GEnie?

Well, as this really has nothing to do with the ST, you might as
well email this info to me. I'll summarize to the net if there
is any interest.

Which floppy drives are known to work properly with the ST?

I built an external drive using a Chinon mech. It worked fine after
I solved the media change problem, but now it has other problems
(lots of errors), so I want to replace it.

1652. Gulam question

Newsgroup: comp.sys.atari.st
Date: 1990-09-06 15:08:22 UTC
From: pwp@iuvax.cs.indiana.edu
Message-ID: <56683@iuvax.cs.indiana.edu>
Source record: 238875

In gulam the foreach command can be used to do something for each file
in a directory. The if command can be used to test whether the file is
a regular file a directory, etc. Is there some way to test what the
extension on a file is? I don't see how to do this from reading the manual,
but maybe I have overlooked something.

The following (except for syntax errors) suggests what I would like to do

```
foreach ...\i { * }
if $i.arc
arc -l $i
ef
echo $i
endif
endfor
```

With a valid test for the arc extension, this file would produce a listing
of the contents of all arc files and the name of all other files.

(Note, it is easy to do half the job: foreach ...\i {*.arc} will get
all the arc files; the hard thing is to dget the non arc ones.)

> ABout the new ink for the inkjet printers, the new cartridges
> will REPLACE the old ones in the older models on the DeskJet, Correct?

Yessir, it's a direct replacement for the old cartridge. Sometimes we
do things right and engineer backward-compatibility into our products.

Tell your friend to keep his DJ.

If I download a .zoo file from somewhere, and then transfer it to a Mac, is there any way that I can pull it directly off of the Mac disk and put it on an ST disk? I'm looking for some sort of PD software program that would do this, but commercial software recommendations would also be helpful. Also, if I wanted to use a null modem to accomplish the same thing (between Mac and ST), how would I set up the connection? And then can I transfer at 9600 baud?

Andy Bates.

1655. Upgrading Your DeskJets to DeskJet 500's

Newsgroup: comp.sys.atari.st
Date: 1990-09-06 17:05:35 UTC
From: close@lunch.wpd.sgi.com
Message-ID: <1990Sep6.170535.1643@relay.wpd.sgi.com>
Source record: 238874

Hewlett Packard's Dave Neff gave the following information about upgrading
older DeskJet models to DeskJet 500's:

- As for the upgrade, the incremental improvements between a
- DeskJet+ and DeskJet 500 are not that large, so I suspect most
- people wont upgrade for $175. But the improvements between the
- DeskJet and DeskJet 500 are very great, and a $225 upgrade for
- these people is a very good deal (and its about time in my opinion).
- The DeskJet 500 is more than just "new fonts and firmware" relative
- to the DeskJet+. An upgrade does require a new electronics board,
- which is the major cost in an upgrade (hence the similarity in
- prices between the DeskJet upgrade and DeskJet+ upgrade). A
- DeskJet upgrade also requries a new motor, service station changes,
- and a new key panel overlay, so it costs more, but is a very reasonable
- cost in my opinion -- considering what it involves.
-
- In the past, it seemed unfortunate that we never had a DeskJet to
- DeskJet+ upgrade, but now that the DeskJet 500 is out, it is good
- that we didn't have people paying for a DeskJet to DeskJet+ upgrade
- and then paying again for a DeskJet+ to DeskJet 500 upgrade :-).

- The Atari CD-ROM player that has been held back from release.
-
- Really. I asked about it, and I was told that it is a "teaser", and
- it wasn't for sale. Unfortunately, I had to make it to San Francisco
- in less than an hour (this was at 5pm, in Santa Clara) and couldn't
- try it out. It wasn't running at the time, but it sure seemed
- interesting. It looks like the pictures, an unassuming unit. Next
- time I am able to spend more time, I'll try to get a demo or
- something, and perhaps try one of my CDs on the thing.

When you were in SF, you should have stopped by Computer Rock.
They've had a CDAR running on their Mega 4 since I can remember.
They publish a couple of CDs for it; one is PD software and the other
is clip art. They sell the drives for around $650 I think. Maybe
less.

Their BBS used to be running off one, but they decided to go with a
386 clone (at least they SAY it's a 386 clone :^) so they can have
three CD ROM drives on-line (one for ST, one for Mac and one for IBM).
I think they still have 3 phone lines, but were planning on adding one
a month until they hit 9.

1661. So you wanna start a system?

Newsgroup: comp.sys.atari.st
Date: 1990-09-06 22:29:38 UTC
From: gaudreau@juggler.East.Sun.COM
Message-ID: <2564@east.East.Sun.COM>
Source record: 238884

Hello, and howdy.

I've been lurking on c.s.a.s for a while and it's time for me to get an Ste. The question now is to sift through the large and bewildering mass of information that I think I know about. What I would like to get from my fellow Netters is some advice on the current state of knowledge on Ste/St's. I'm not looking for specs as much as system info (like how to config the system and make it useful, make it fly, etc).

Below is a list of some "basic, naive" items. Please send e-mailed responses and I'll summarize when I get enough "stuff."

Thanx in advance. Really :-) It seems like there is too much out there to know before you take the jump...

Let the Questions commence,

* Ste hardware -
o Places (address/phone) on where to buy them. Cost? Memory available. Tos 1.62?
o Where to get simms at low, low prices :-)? Speed needed?
o Hard-drive - like 80meg or so. Suggestions? Software needed for them? Problems with Ste? How to fix?
o Monitors, Tv is probably out, so any decent multi-syncs that won't cost more than my car? I'd like color mostly, mono compatibility would be nice. Even official Atari.
o Spiffy little add ons like mouse cable savers, etc...
o I'm out-of-touch with dot-matrix printers these days. 24 pin? Will an old Epson Mx-80 do adequately for straight text/listing/source?

* Ste software -
o Commercial, Shareware, Freeware, Copyleft, what have you.
o The archives that a lot of this is located on. Like the comp.binaries.atari.st & comp.sources.atari.st. Where are they? Additional sources?
o What is required for patches to make the beast work correctly?
o Alternate desk tops.
o Alternate OS's.
o Un*x type shell(s) with Un*x-type utilities?
o Languages -
o C - What's good for *serious* work*? MWC? Gnu? Turbo C (germ/eng). Where to buy? I hear that translated English docs are available for registered owners.
*What's serious? Large programs, good code generation, graphics, sound, uhhh... Games... OS's... Sequencing sw... that's the ticket.

o Lisp, Scheme, Prolog, PostScript, Pascal, etc.
o Editors - Emacs is the only one for me. Full version of Gnu-Emacs would be great as well as micro-Emacs for quick-n-dirty edits...
o Graphics, painting, modeling (2d,2d), raytracing...
o Cool demos... Sound, Graphics.

* Ste music software/MIDI -
o I would love to know about tutorial software, sight reading, ear/interval/pitch training, theory.
o Notators/Sequencers (integrated) that produce PostScript output that bears some semblance to real(tm) sheet music.
o Editor/Librarians...
o Whatever.

* Games, uhhh, for my kids...
o I like the classic and not so classic blast'n'shoot types. What's good?
o What's really good? Why?
o Adventure types...

* Any other suggestions? Anything? Thanx.

I have been going nutso trying to find some good books on the ST.
Specifically reference manuals for programming. I was given the Compute
ST programmer's guide when I bought the computer, but have do not have
anything else. The most that I have seen is some very elementary users
guides, and a book for kids who use the ST by compute.
All the books stores that I have been to say that I need title names to
get any kind of books from special order, so please forward to me
any titles of good reference materials for the atari ST, and I would greatly
appreciate it!

Also, if anyone knows the address or phone number (or net address if there is
one) for Atari Computers Publications (i.e. manuals, schematics, etc) I
would appreciate that as well!
Thanks

swood

>

Sigh.... The more that I look at this, the less I think of it.

I personally would recommend GEnie to my friends as an excellent value
if the $4.95 allowed accessing the message bases. I have *never* paid
to read BBS messages on GEnie (too high a signal/noise ratio at $6/hr).
I have used the download capabilities at $6/hr (not at $10) off and on.
I am willing to pay for downloads, but not for reading their BBS traffic.

Before I realized that PC BBS traffic was not included, I was thought
that this was a good setup. Now, I think it isn't. What do other
net readers think about this? (yes, I realize that I am spoiled by Usenet..)

My question is, will the ink used to fill the cartridges be made
generally available? I've always refilled my DJ cartridges with Skrip Jet
Black Ink. The one in the printer is now on its 6th refilling, I've so far
saved about $100. And print quality is still as high as it ever was.
Or is a non-smearing ink already available, and if so, what is it?

The one problem I can think of is if they close off that hole in the
top of the cartridge (which I can see happening if the new ink tends to dry
out). If that's the case, I'd better buy a few now for refilling use later,
or plan on drilling holes.

Incidentally, I've also refilled with Skrip blue ink, and it works
just dandy. It just takes awhile to flush the old black ink out. Red is
too thin and tends to clog; diluted with black it's too dark and still clogs.
Maybe chart recorder ink would work better ....

They have been available here (NZ) for a bit longer than I can
remember (at least 12 months, but is was so long ago I really can't
remember exactly). They have sold in very limited numbers, mainly
because they have very little support and are priced at NZ$1750
(US$850 I guess).

The unit presently come with developers documentation and example code
and progs aimed at developers. Atari offer _no_ disks for the unit at
all (although is does play music CD's ok :-), so you must rely on
third party sources (the doc's say it supports the Hi-Sierra system).
The buyers I have spoken to have been either developers or BBS's. The
Atari BBS with one I have rung had a disk with lots of PD software and
PD 'C' code for the ST on-line for downloading.

I've seen no mention of any other support or developments for the unit
since it was initially available (surprise, surprise :-(

>>are most welcome to do so.
>
> This is incorrect.

Well, now that I've seen the GEnie magazine supplement, I must admit that there will be the $4.95 charge. The on-line message was a bit misleading in my opinion (and that's the only thing I'd read...)

At the same time, the hobby RT's which one can access for free is pretty impressive (if you're not a computer-freak). I doubt that the majority of people who log on to GEnie have access to USENET, so the science-fiction RT would be pretty popular for non-rec.arts.sf-lovers readers. Likewise, the religion RT is fairly popular among non-talk.misc.religion readers. If you NEVER log onto GEnie for more than an hour a month at 2400 baud, I guess you'd have some reason to complain. But then again, if you're like me, and spend several hours on-line per month, the 'charge' is well worthwhile.

> You MUST pay them $4.95 monthly, PLUS the regular $6.00/hr for machine
> specific Roundtables, like the ST Roundtable.

Of course, that NOW INCLUDES 2400 baud access for $6.00/hr vs $10.00/hr previously. (IE. I now save money after the first hour's download).

>
> Delphi on the other hand gives you a choice of being billed per hour with no
> monthly minimum, or paying $20 a month for 20 hours of connect time.

I don't know -- perhaps if everyone were paying the 'true' costs of access to comp.sys.atari.st there wouldn't be such a level of indignation.

Did you try to use the extended `termcap' entry that is floating around;
I think it's origin is some Databecker book, but I may be wrong. It really
worked for me.

But I have discovered a related problem with starting up emacs 18.55 on my
Atari ST 1024 (GEM v1.0): when I start it up from desktop, it doesn't
calculate my screen size right. Lines (in the middle?) are blank, while there
should be at least some characters on it. The strange thing is, that it is
fixed by starting up gulam first, then exiting gulam and starting emacs from
the desktop. Strange, isn't it. Does gulam perform some sort of initial screen
setup?

Alexander.

Well, there are 2 cd roms:

>>mfolivo@sactoh0.SAC.CA.US (Mark Newton-John) writes:
>>
>>When you were in SF, you should have stopped by Computer Rock.
>>They've had a CDAR running on their Mega 4 since I can remember.

>>less.

As I posted before, I have one, and it will play music and read MS/Dos
CD-roms (high sierra format). It comes with 3 format readers.

What it will not do is read multi media cd roms. That is it will only access
1 partition of data. You can play music, but not read it.
MAC CD Roms that combine music and data can not be accessed after the 1st
section (partition).

While you can easily read ms/dos files into the atari they usually need
processing with a ms/dos program (data base manager).
I hacked PCDITTO I to interface to the Atari CDAR, and it emulates the PC
doing MSCDEX (Microsoft CD Extensions) and then can read the CD ROM just
as a PC would.

Well, I tried this once before, but my math was pretty
bad...so I'll try again. The 20/20 plan is quite some "way
around" the monthly charge...this is $240 over a full year. I
imagine one could get a good piece of equipment for that, e.g.
a printer, modem, SpectreGCR...as a matter of fact, I may just
get myself the latter with the money I'll be saving!
--Gerry
PS...just think if you don't use all 20 hours in one month!
You think they'll let you carry any over?

>

Well I guess I am not the only one experiencing a problem, but mine is
probably not related to yours (sounds like yours is the difference between the
software and hardware clocks, don't really know).

When I boot up using the same hardware and software the date is set just fine,
but when I run Interlink, sometimes the clock is totally reset, and the hard
drive clock is also reset. From that point on, I have to reset and rewrite
the time back to the ICD clock. Don't know why, but Interlink is the only
program that does that...

Can anyone help or has anyone seen that problem?

First off, should you suddenly get an ftp program that does understand
names, the archive is called atari.archive.umich.edu.

Second, the ip address of atari.archive.umich.edu is 141.211.164.8.
U of M recently got of the 35 network and moved to a few class B
networks.

1685. Calamus book finally going public

Newsgroup: comp.sys.atari.st
Date: 1990-09-08 05:05:29 UTC
From: david@doe.utoronto.ca
Message-ID: <1990Sep8.050529.7610@doe.utoronto.ca>
Source record: 238807

ISD is finally releasing its book The Guide to Calamus Desktop Publishing for general distribution. The book has been available for several months by direct mail to registered owners of Calamus, but it was not possible to just walk into the store and buy it.

The book is meant to make up for the horrible deficiencies in the original Calamus documentation as well as to teach advanced techniques and tricks in DTP. I think it is good, but I know the author so I may be biased. It has been out in Canada, the US and Australia for a while, and the UK has just picked it up. Apparently, one of the large UK ST magazines (ST World?) has a review of it, but I have this 4th hand.

Here is the reference:

Robinson, Bonnie. The Guide to Calamus Desktop Publishing. Toronto: Ditek Intl., 1990. ISBN 1-550-84-000-2.

1687. Portfolio 640k

Newsgroup: comp.sys.atari.st
Date: 1990-09-08 07:56:15 UTC
From: mfolivo@sactoh0.SAC.CA.US
Message-ID: <3922@sactoh0.SAC.CA.US>
Source record: 238809

Well, I found out how to expand a Portfolio to 640k. It entails the new HPC-104 memory expansion. Adding one gives you 256k more, and a second card slot, but adding a second gives you 640k total. And if you add on the serial or parallel interface, you have one long hand held computer!

No, I do not thing that the second card slot is usable as D:\, it's probably configured for B:\, and the Portfolio can only access three drives.

Since the expansion bus is "standard PC" does that mean someone could engineer an expansion box, with a standard video card, etc?

The only place I have seen the full line of Portfolio products is B&C Computervisions in Santa Clara. We don't have the HPC-104 yet, but we have everything else.

1688. Canon Bubblejets

Newsgroup: comp.sys.atari.st
Date: 1990-09-08 08:07:53 UTC
From: mfolivo@sactoh0.SAC.CA.US
Message-ID: <3923@sactoh0.SAC.CA.US>
Source record: 238810

Does anyone have any recommendations on Canon Bubblejets? I have
oticed that the price has come down recently, and I think that they
are less expansive than Deskjet 500s.

I know that the ink doesn't smear like the old DJs, and I like the
output I've seen on their word processor and a BJ I saw about two
months ago.

Since prices are falling on DJs and BJs, I was going to get a
Panasonic 1124, but might spend the extra money and get either H-P
or Canon.

1689. TT desktop & prices

Newsgroup: comp.sys.atari.st
Date: 1990-09-08 09:27:07 UTC
From: felner@b.inf.ethz.ch
Message-ID: <6648@neptune.inf.ethz.ch>
Source record: 238805

Today I finally had a chance to see the 32MHz TT live on a big trade show here in Switzerland.

What impressed me most and what seems not to be known so far to the general public, is the new TT desktop. Do you like shells like NeoDesk and Gemini? Well, now you can have most of their functionality on your TT, in the official Atari TT TOS. Here are some first impressions from the new desktop after playing around with the TT for about an hour:

- quite a few new menu entries have been added in the desktop
- most (or all?) menu entries can be invoked with a single keystroke and those keys are user configurable
- you can assign a full pathname to the function keys and thus invoke your favourite programs with a single function key keystroke
- you can now have an unsorted index (nice for auto folders)
- you can choose the background color from a menu entry
- there's a menu entry 'Desktop Configuration' where you can set and configure quite a few things, which I don't all remember
- you can select a number of logical drives and then search for a file/folder on all those drives. When the search was successfull, a window with the file/folder opens. And this search is very fast!
- you can read another .INF file and thus change the look of the desktop
- you can switch between several different color tables
- you can have a different border, text and background color for each part of a window (like close button, expand button, title bar, vertical scrollbar, left arrow, up arrow, etc ...)
- you can drag any files on the desktop, leave them there, assign different icons to them, and give them different names (i.e. move the 1stWord icon to the upper left corner, change the icon to something cute looking, and name it "Wordprocessor")
- those icons apparently can be edited somehow and you can add you own ones (I didn't see this but someone told me)
- there's a completely new control accessory with many new options
- there's a new and fast GDOS
- and probably there's a lot more I didn't find out about ...

I really liked all those new features. I am only surprised that no one ever mentioned this so far. How come? The version I played with was in German. Maybe it's a product of Atari Germany and not yet available in English, but I have no idea? Anyway, congratulations to those Atari hackers (Ken, Alan ?) who came up with this!!!

But now for the big question: Are those poor users who cannot afford to get a TT also going to see this new desktop on their 520, 1040 and Megas? If the answer is yes, when is this going to be the case?

And here comes an answer to the question 'How much will I pay for a TT?'.
The following are the official prices from Atari Switzerland. The TT is
supposed to start selling these days here in Switzerland (and also in
Germany I think). (US$ 1.- = SFr. 1.30)

Basic set: TT, 68030, 32MHz, 40MB disk, 720KB floppy, mouse, keyboard

Basic set with 4MB: SFr. 4990.- (US$ 3850.-)
6MB: SFr. 5690.- (US$ 4380.-)
8MB: SFr. 6290.- (US$ 4850.-)

Extra: PTC1426 Multysync color screen, 14" SFr 990.- (US$ 760.-)
PTM146 Monochrome screen, 14" SFr 330.- (US$ 250.-)
TTM194 Monochrom screen, 19", 1280x960 SFr 1890.- (US$ 1450.-)

So a 4MB, multisync system is approx US$ 4600.-
a 8MB, multisync system is approx US$ 5600.-

Now I am curious about the reactions to all this information ... :-)

Tomas Felner, felner@inf.ethz.ch

Disclaimer: I am not affiliated to Atari at all. I am just a user who
reports to the net what he has seen on a big trade show in Switzerland.

>> else in Tempus appears to be OK.
>
>> Has anyone else seen this? Is there a patch available?

Hi Robert!

This bug is normal on TOS 1.4, but the other functions of Tempus will work fine. CCD, the Developer of Tempus, has announced the version 2.10 at the Atari-Fair in Duesseldorf last month. I've made the update for 25,- DM and hope that I will get the disk in a few days. This version will have the bug in the file-selector-box fixed. Also it will have real tab's and will work on displays bigger than 640 * 400 pixels.

Greetings, Olaf

> I'll posting the description what to change as soon as I dug it out.

> Greetings,
> RIPLEY

Thanks from me too, it turns out that I'm running 2.07 also. What I really want though, is access to *my* item selector. Failing that, the next most irritating thing is that Tempus 2.07 won't save the item selector setup properly (in my machine, with all my auto programs including NeoDesk and a lot of stuff in Multidesk). It saves the file name, but not the path, exactly the reverse of what I want, since I keep data on drive D: and executables, Tempus included, on drive E: (ridiculous huh?, but it _does_ make backups easier). While I'm at it, what's the schedule for the word processing version, and who will carry it in the U.S. now that Michtron is getting out of the consumer software business?

Thanks,

Bob Pegram Internet: pegram@griffin.uvm.edu UUCP: uunet!uvm-gen!pegram

1694. Where can I find LINT ?

Newsgroup: comp.sys.atari.st
Date: 1990-09-08 20:12:41 UTC
From: c162-bn@danube.Berkeley.EDU
Message-ID: <27605@pasteur.Berkeley.EDU>
Source record: 238812

I know that a few months ago there was a huge discussion of the availability of lint for the ST. Unfortunately, I didn't know what it was then, and I do now. (IE I skipped the messages about lint, like a bonehead)

The bottom line: Where can lint be found for the ST? Is it available?

Thank you,
Axel Olmos

Source record: 238821

rdb@mtunf.ATT.COM (Ron DeBlock) writes:

|In article <1990Sep5.154351@heike.informatik.uni-dortmund.de>
klute@heike.informatik.uni-dortmund.de (Rainer Klute) writes:
|<There really should be a (configurable) delay between
|<the first and following slider events!
|Since I got the latest WP patch at the same time
|I upgraded to TOS 1.4, I just assumed it was a WP problem.

The auto-repeat slider delay in TOS 1.4 is based on your mouse double-click
setting. If you're having trouble getting single clicks, try setting
a slower double-click speed.

From: kbad@atari.UUCP
Message-ID: <2279@atari.UUCP>
Source record: 238822

I'm sure Atari would be very interested in hearing the name of any
developer who offered you a "used" developer kit. The developer's
kit contains /proprietary/ information and is covered by nondisclosure.

If you want one, contact Atari Developer Support.
Don' know the number offhand, but you can reach the group by snail mail at
Atari Developer Support / 1196 Borregas Ave. / Sunnyvale, CA 94089

From: saj@chinet.chi.il.us
Message-ID: <1990Sep09.023353.9910@chinet.chi.il.us>
Source record: 238817

There's a limit to how hard you can beat on the ST without some 68000 programming documentation. My favorites are:

68000 Assembly Language Programming by L.A. Levinthal, D. Hawkins, G. Kane and W.D. Cramer pub Osborne-McGraw-Hill

and, mostly for addressing and timing information, the Motorola MC68000 16/32-bit microprocessor manual dated October, 1985.

1701. Re: Delphi/GEnie - not such a bad deal

Newsgroup: comp.sys.atari.st
Date: 1990-09-09 05:40:45 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <33691@cup.portal.com>
Source record: 238818

The point is... if you, like most folks, are only using GEnie to access a machine specific Roundtable, like the Atari RTs, the new changes amount to an extra $4.95 per month that GEnie is going to get from you, in addition to whatever you pay for your hourly downloads...

If the only reason you ever call GEnie is to go into the Religion RT, or the Hobby RT, then maybe it's the best thing that ever happened to you.

Hmm... 200,000 members times $5... I think I can guess who's making out with these changes...

1702. Re: CDAR-500 SEEN!!! CD-ROM for ST/Mega

Newsgroup: comp.sys.atari.st
Date: 1990-09-09 05:45:58 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <33692@cup.portal.com>
Source record: 238819

So, does anyone know why the Atari CDAR-500 CD ROM player is not being offere
on the latest Atari Developers' price list..?

(sorry... "Atari Partners", that is...)

BobR

1703. Re: TT desktop & prices

Newsgroup: comp.sys.atari.st
Date: 1990-09-09 05:58:21 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <33694@cup.portal.com>
Source record: 238820

Tomas Felner concludes his report on a sighting of the TT with:
>Disclaimer: I am not affiliated to Atari at all. I am just a user who
>reports to the net what he has seen on a big trade show in Switzerland.

Thank you, Tomas..!

Since Atari won't tell us anything at all about the TT, it's good to hear
a report from a "real person"...

It sounds as if the new desktop will be very nice... I too am surprised
we've never heard about those features before.

Maybe when a "real person" actually gets hold of a TT, we'll know more...

1705. New MINIX available (UNIX clone with full source code)

Newsgroup: comp.sys.atari.st
Date: 1990-09-09 11:13:47 UTC
From: ast@cs.vu.nl
Message-ID: <7485@star.cs.vu.nl>
Source record: 238823
Cross-posted to: comp.os.minix,comp.os.misc,comp.sys.atari.st,comp.sys.amiga,comp.binaries.ibm.pc.d

1. WHAT IS MINIX 1.5
MINIX 1.5 is a new version of an operating system that is very similar to
UNIX. MINIX has been written from scratch, and therefore does not contain any
AT&T code--not in the kernel, the compiler, the utilities, or the libraries.
For this reason it can be made available with the complete source code
(on diskette). It runs on the IBM PC, XT, AT, PS/2, 386, and most clones.
Versions are also available for the Atari ST, Macintosh, and Amiga.

This version (1.5) is a major improvement over all previous releases, with
many new features, fewer bugs (hopefully), much better performance, and
proper documentation. The old versions have been in widespread use all over
the world for 3 years. There are probably tens of thousands of users.

2. MINIX 1.5 FEATURES (IBM, Macintosh, Atari, and Amiga versions)
- System call compatible with V7 of the UNIX operating system
- Full multiprogramming (multiple programs can run at once)
- Kernighan and Ritchie compatible C compiler
- Shell that is functionally identical to the Bourne shell
- Five editors (emacs subset, vi clone, ex, ed, and simple screen editor)
- Over 175 utilities (cat, cp, ed, grep, kermit, ls, make, sort, etc.)
- Over 200 library procedures (atoi, fork, malloc, read, stdio, etc.)
- Spelling checker with 40,000 word English dictionary
- Full source code (in C) supplied on diskettes (OS, utilities, libraries)
- Easy-to-read manual telling all about MINIX and how to install and use it

3. ADDITIONAL FEATURES
In addition to the above features, there are other features present in
some (but not all) versions of MINIX 1.5. Some of these are listed below.

3.1 ADDITIONAL MINIX 1.5 FEATURES (IBM VERSION):
- Runs in protected mode on 286 and 386
- Support for extended memory up to 16M on 286 and 386
- Up to 3 simultaneous users on one machine
- RS-232 serial line support with terminal emulation, kermit, zmodem, etc.
- Distributed computing on Ethernet (remote login, etc.)

3.2 ADDITIONAL MINIX 1.5 FEATURES (MACINTOSH VERSION):
- Up to 3 simultaneous users on one machine
- RS-232 serial line support with terminal emulation, kermit, zmodem, etc.
- Runs under Multifinder
- Includes support for multiple user windows

3.3 ADDITIONAL MINIX 1.5 FEATURES (ATARI ST VERSION)
- Up to 2 simultaneous users on one machine
- RS-232 serial line support with terminal emulation, kermit, zmodem, etc.

- Support for various real time clocks (Mega, BMS, ICD, Supra, Weide)

4. HARDWARE REQUIRED
- IBM: PC, XT, AT, PS/2, or 386 that is 100% hardware compatible with the IBM line. A hard disk not technically required, but is strongly recommended to take full advantage of the system. At least 512K of RAM is required, as well as a CGA, EGA, monochrome, or Hercules video card, or another card that emulates one of these. Both 5.25" and 3.5" diskettes are supported, as are printers using the parallel port and modems and terminals using the serial port.

- Macintosh: Apple Macintosh Plus, SE, SE/30, II, IIcx, or IIx with at least 1M of RAM. An additional 1M of RAM and a hard disk is strongly recommended. MINIX has been tested primarily with version 6.0 and latter of the Apple system software. Problems may conceivably arise with earlier versions. Any hard disk or display that is supported by the normal Macintosh OS is also supported by MINIX.

- Atari: Atari ST or Mega ST with at least 1M of RAM. Although the system will boot with only 512K, you will be very restricted in what you can do. A 720K diskette drive is required to install the software. The older 360K diskette drives are supported, but are not capable of reading the (720K) distribution disks. A hard disk is supported, but is optional.

- Amiga: Commodore Amiga 500 or 2000 with at least 1M of RAM. One 720K diskette drive is sufficient. A hard disk is not required (or even supported). To use a hard disk with the Amiga, someone familiar with how this disk works will have to write a driver for it. If this driver is then posted to the net, it will be possible to use a hard disk with MINIX on the Amiga.

5. PARTIAL LIST OF UTILITIES INCLUDED IN MINIX 1.5

App. A MINIX SOURCE CODE LISTING
App. B CROSS REFERENCE MAP

8. MINIX BOOK
The author of MINIX, Andrew S. Tanenbaum, has written a book describing
how operating systems in general and MINIX in particular work internally.
The book describes an earlier version (and includes a source listing), but
it is still useful for understanding how MINIX works inside, even if some
details are now different. The bibliographic information is:

Title: Operating Systems: Design and Implementation
Author: Andrew S. Tanenbaum
Publisher: Prentice-Hall
ISBN: 0-13-637406-9

Paperback versions are also available in English (outside North America only),
French, Spanish, Italian, and Japanese. The books can be ordered from any
bookstore.

9. HOW TO ORDER MINIX 1.5
MINIX 1.5 is being sold by Prentice-Hall. The product numbers and prices
are as follows:

- MINIX 1.5 for the IBM: 5 1/4" (0-13-585076-2) $169
- MINIX 1.5 for the IBM: 3 1/2" (0-13-585068-1) $169
- MINIX 1.5 for the Amiga (0-13-585043-6) $169
- MINIX 1.5 for the Atari (0-13-585035-5) $169
- MINIX 1.5 for the Macintosh (0-13-585050-9) $169 (available Oct. 1)

Sales tax and shipping are extra; Prices are slightly higher outside the U.S.

All versions include the executable binaries, a detailed manual, the complete
source code (on diskettes), and an attractively typeset, cross-referenced

listing of the operating system code.

P-H is making a big effort to get software stores to keep MINIX in stock. The easiest way to order it is to go to a software store and ask them for it. If they don't stock it, they can always order it. Alternatively, you can order directly by email, FAX, phone, or mail from Prentice-Hall as follows.

In North America and the Far East
To order by email: books@prenhall.com
To order by FAX: (201) 767-5625
To order by phone: (800) 624-0023 or (201) 767-5969
To order by mail: Microservice Customer Service
Simon & Schuster
200 Old Tappan Road
Old Tappan, NJ 07675

In UK/Europe
To order by email: books@prenhall.com
To order by FAX: +1 (201) 767-5625 (US number)
To order by phone: +44 (442) 231-555 (UK number)
To order by mail: Order Dept.
Prentice-Hall International
66 Wood Lane End
Hemel Hempstead
Herts. HP2 4RG ENGLAND

For email and FAX orders, please include the product name and number, your name and address, and your MasterCard or VISA card number and expiration date. If you wish delivery by Federal Express (costs extra), please indicate so.

MINIX can also be ordered from the following addresses:

In England: The MINIX Center
Forncett End
Norwich
Norfolk NR16 1HT England
0953-89345

In Germany: Steve Steinkrauss
Feldtorweg 24
D3406 Bovenden 1
Germany

In the Benelux: Fred van Kempen
Postbus 184
2100 AD Heemstede
Holland
Tel: +31 23 287935
FAX: +31 23 294229

In Scandinavia: Frank O'Donell
P.O. Box 88
1371 Asker

Norway

In Spain and Deborah Worth
Portugal: Appartado Numero 50672
Madrid
Spain

In Italy: Jim Blaho
Piazza Santo Spirito 17
50125 Florence
Italy

In Greece: Vassilis Zahos
Kritonos 5-7
GR 11634 Athens
Greece

In Turkey: Atilla Gullu
Milli Mudafaa Cad 14/7
Kizilay Ankara
Turkey

If you have previously purchased MINIX from Prentice-Hall, you can get a discount of $60, but only if you order by mail and include the label from the original PH boot disk (or the entire disk) with your letter. Not valid for email, phone or FAX orders since you must enclose the original boot disk label (not a photocopy). Mail orders can be by credit card or check for $169. You will be billed for tax and shipping.

10. LEGAL STATUS OF MINIX
Although MINIX is supplied with the complete source code, it is copyrighted software. It is not public domain. It is also not like GNU. However, the copyright owner, Prentice-Hall has granted permission to bona fide universities to copy the software for use in courses and in university research projects. It is also permitted for MINIX owners to change the software to suit their needs and to distribute diff listings containing their changes freely. The shrink-wrap license that comes with MINIX states that you may legally make two backup copies of the software. Prentice-Hall is being much less strict than other software vendors. Please do not abuse this. Companies that wish to embed MINIX in commercial systems or sell MINIX-based products should call (212) 995-7788 to discuss licensing terms.

11. NEWS ABOUT MINIX
Since its introduction in January 1987, there has been a large an active USENET newsgroup about MINIX, comp.os.minix. It currently has about 25,000 members. Over 12,000 messages have been posted to this group so far. These messages have contained questions, bug reports, bug fixes, new software, and diff listings to allow current users to update to new releases for free. It is the intention to continue this policy into the indefinite future. MINIX users on Bitnet can be put on a mailing list by sending mail to: info-minix-request@udel.edu. Various archives store newsgroup traffic for newcomers to the newsgroup.

12. FUTURE PLANS
The major current project is bringing MINIX into conformance with the IEEE POSIX P1003.1 and P1003.2 standards. This will (hopefully) occur with V2.0, perhaps in 1992. V2.0 will also be provided with an ANSI C compiler. Various people are currently working on 32-bit versions of MINIX for the 386, and numerous other projects. To keep up, subscribe to the comp.os.minix newsgroup.

13. WHERE CAN I GET PAST POSTINGS AND PROGRAMS?
Many sites keep archives of MINIX-related material, ranging from archives of articles posted to more organized repositories of programs posted to the net. The complete MINIX distribution is NOT (repeat NOT) available from any online archive. This is not permitted. Only the newsgroup traffic is stored there.

List Archives:

bugs.nosc.mil Current

13.1. File Transfer on the Internet
If you are on the Internet, you can get files from many places with the file transfer protocol ("FTP"). When connecting to the host system, use the user-name "anonymous" and any password. Most systems will ask for your "ident" as a password. It is considered good etiquette to use either your login name or mail address when asked. Once connected, look for a "README" file which should give further information about the archive.

Consult your local documentation on the use of your FTP application program (generally called "ftp"). Please be nice to the FTP sites by restricting your use to non-business hours.

The following sites provide Anonymous FTP

aerospace.aero.org [130.221.192.10]

comp.os.minix archives (not current)

13.2. Mail Servers
Some archive sites provide access to their archives with a server program
that responds to commands mailed to it.

13.2.1. doc.ic.ac.uk
An archive of the worthwhile postings from the comp.os.minix newsgroup is
available from uk.ac.ic.doc either via mail or by GUEST niftp. For details
about how to access this service send a mail message with NO Subject: field
to:

info-server@uk.ac.ic.doc

and a message body of:

request catalogue
topic minix
request end

This will mail you back details of the various ways to obtain the files.
This service is only available inside the UK. We have no funds to send
such mail internationally.

This archive service is run by Lee McLoughlin.
Janet: lmcl@uk.ac.ukc, lmjm@uk.ac.ic.doc
DARPA: lmjm%uk.ac.ic.doc@ucl-cs
Uucp: lmjm@icdoc.UUCP, ukc!icdoc!lmjm

13.2.2. NL-MUG
The MINIX User Group Holland (abbreviated to NLMUG) maintains an archive
of interesting documents, sources, binaries and patches for the MINIX
operating system. In the future, an archive of all USENET (comp.os.minix)
articles will be kept as well.

The archive can be used by sending e-mail messages to one of the
following addresses. To join the archive send a message to:

Internet: arch-adm@minixug.hobby.nl
Uucp: ..!hp4nl!hgatenl!minixug!arch-adm

For sending requests, send a message to:
Internet: archive@minixug.hobby.nl
Uucp : ..!hp4nl!hgatenl!minixug!archive

The "Uucp" address should be used ONLY if your mailer cannot handle
internet-style addresses, or if the message bounced back to you.

Since the NLMUG Archive is a (more or less) private archive, we cannot
afford ourselves to make it an open archive. In Europe, we must pay a
quarter for every Kbyte of mail being sent out. This means, of course,
that we want to know who use the archive. It is our goal, to only LOG
the usage. We don't intend to BILL people for using the archive...

Because of all this, the server looks at the requester's name, and sees
if it may access the archive. Usually this is OK, but if people start
misbehaving, they might get locked out. This is mainly the case when
people have downloaded tons of stuff, without a single introduction first.
We do NOT appreciate anonymous file transfers! Therfore, send a short
message introducing yourself to the Archive Administrator to keep him
happy. The Archive Service is actually a program running on a MINIX system.
It is started once a day by cron(1) to have a look at its mailbox.

To use the archive, you should first send a request to the archive
administrator (arch-adm) requesting access to the archive. After you have
received an acknowledgement of your request, get the server's help file by
sending a message to the server (archive) saying:

HELP

and you will be sent details on using the server. This server is maintained
by Fred van Kempen <waltje@minixug.hobby.nl>

13.2.3. plains.nodak.edu
An archive of MINIX upgrades and other interesting files are kept in a

manually-maintained archive on Plains.NoDak.edu [134.129.111.64].

For those not fortunate enough to be on the Internet itself, we run the Clarkson server to process mail requests. This is an extremely versatile program, that allows various encoding formats (btoa, uuencode), compression (compress, arc, zoo) and splitting of large files. The server has been customized to send HELP and Index files at any time, and all other files between 23:00 and 08:00 local time. If you submit a request that contains *any* file that is not a Help or Index file, the entire request is queued until late night (currently 23:00 local time, but that may be moved to earlier hours of the morning if it proves to be a large load on the system).

The addresses for the server are:
archive-server@plains.nodak.edu
{umn-cs, ogicse, uunet}!plains!archive-server (UUCP)
fileserv@plains (Bitnet)

Note to Bitnet people: this server is not 'logged on' to the machine, so you cannot send it interactive messages. The 'fileserv' alias was added for those of you who do not run the Croswell mailer, but you must still use something that is detectable as mail (such as a NOTE). Bitnet files will drop into our bit bucket, unprocessed, since there is no real user by either of these names.

To obtain a list of the files, the INDEX command is used:

index [<directory>]

where <directory> is a directory under our ~ftp/pub login(empty for the main directory). There are several other directories of programs for microcomputers, current volumes for comp.sources.* and some of the Free Software Foundation's products.

The SEND command is used for having files sent to you, such as in:

send MINIX/doc/Info_Sheet

That file is a copy of the monthly "MINIX Information Sheet" posting. The MINIX Compatibility Report is available in the file "MINIX/doc/Compatibility".

There are many more options for having your files compressed (note: most files in these directories already have been compressed with 13-bit compression), uuencoded, split, and so on. To obtain more information on the server, send the command:

help

and you will be enlightened. The server accepts commands in mixed case, but all directory/file names are case significant (just like MINIX).

This archive is maintained by Glen Overby, <minix@plains.nodak.edu>, at North Dakota State University, Fargo, ND USA (46 52 N / 96 48 W city)

13.2.4. vm1.nodak.edu
North Dakota State University is the host site for distribution of the

info-minix mailing list (also known as minix-l), which is bidirectionally gatewayed to the Usenet group Comp.os.minix. We maintain archives of all list traffic from within the past year or so (depending on space availability). Archives are available via Anonymous FTP on the Internet, and LIST-SERV file requests from other networks.

Our server is:

Internet: listserv@vm1.NoDak.EDU [134.129.111.1]
Bitnet: listserv@ndsuvm1
UUCP: psuvax1!ndsuvm1.bitnet!listserv
uunet!plains!vm1.nodak.edu!listserv

If you do not have Internet access, you may request files be sent to you by our LISTSERV file server by sending it commands in the body of a mail message.

To obtain a list of the files, the INDEX command is used:

INDEX MINIX-L

The GET command will instruct LISTSERV to send you a file, such as:

get minix-l LOG9005A minix-l

to get the file "MINIX-L LOG9005A" from the directory "MINIX-L". The filename tells what year, month, and week it is from:

MINIX-L LOGyymmw

where "yy" is the year, "mm" is the numeric month and "w" is an alphabetic character from A to E indicating what week of the month. Several months of log files are kept on-line, the number depending on disk space availability.

Due to the 80-character per line (punched card) limit on Bitnet mail, many of the files will be shipped using an encoding scheme that allows logical lines to be split up into many physical lines. On Bitnet, this is normally the IBM "DISK DUMP" or "NETDATA" format, and for ther networks it is "List-serv Punch".

Listserv Punch was designed by Listserv's author and is designed to send files with lines longer than 80 characters thru the Bitnet gateways. A special program to decode the file once it has arrived at your site. Information on obtaining a program to decode listserv punch format is sent with each encoded file.

If you would rather have a file sent to you uuencoded, you may specify that in your GET command:

get minix info minix f=uuencode

please note that the file, once decoded, will be in EBCDIC!

SEARCHING THE MAILING LIST LOGS WITH LISTSERV

If you are looking for a specific article, or set of articles, you can perform searches on this directory using the Database functions of Listserv.

For example, to obtain a "Subject" index of the MINIX-L archives, send the listserv a file or mail with the following "job" in the message body:

```
// JOB Echo=No
Database Search DD=Rules
//Rules DD *
search * in minix-l since 90/04/01
index
```

and you will be sent a file containing all of the 'Subject:' lines sent to the mailing list since December 1, 1989. If you wish to request one or more items, replace the 'index' line in the above job with "print [ref-num]", where "refnum" is the reference number from the index listing. Documentation on this and other database functions is available by sending the command "INFO DATABASE" to the listserv.

To obtain more information on the listserv, send the command:

```
INFO ?
```

and you will be enlightened with a list of available documentation on using LISTSERV.

This archive is automatically maintained by the list server. If you have questions, contact Glen Overby, <minix@plains.nodak.edu>, at North Dakota State University, Fargo, ND USA (46 52 N / 96 48 W city)

13.3. Publicly accessable Bulletin Boards
For people without a network connection, there is a PC-based Electronic Bulletin Board System (BBS) that has carried the traffic of Usenet's Comp.os.minix steadily since August, 1987 as well as a formal MINIX archive.

The BBS is not a true gateway to Usenet, like some Fidonet nodes are; rather it is a "delivery service" whereby new comp.os.minix articles are gathered daily and posted as messages on the BBS. Long articles are automatically ARC'ed and posted to the file area for downloading. Raw traffic is kept for about 2 months.

Once a month the articles of lasting interest from the previous month are saved into several ARC files, all less than 100K, to make downloading easier. For any given month, the index of articles is in MNXyymmA.ARC, and the actual articles start in MNXyymmB.ARC. You can just download the index, then download the ARC files that contain articles of interest to you.
A complete index is always in MNXINDEX.ARC.

Call:
The Mars Hotel BBS, (301)277-9408 (PC-Pursuitable)
300,1200,2400 baud, 8,n,1.

No registration required, no donations accepted.
Everyone gets 60 minutes/day.
No upload/download ratios (but don't be a jerk!)

Spread the word to those without net access.

This BBS is run by James da Silva.

>whatever you pay for your hourly downloads...
In addition...if you miss a month or two, it is that much more
they're going to get from you than they would have otherwise.
>
>Hmm... 200,000 members times $5... I think I can guess who's making out
>with these changes...
>
>BobR
Well, I believe this is going to be my last posting on this
topic (and the crowd breaks into a standing ovation!)...I've
now let Genie and Delphi know that I've quit, why I've quit,
and that they might find others who feel the same way. I just
got Genie's monthly magazine the other day. In it they say
the new service has something for everyone...I guess I'm not
a "one", because it certainly doesn't have anything for me.
Just one last thing...if you don't like their changes, be sure
to let them know (i.e. don't just let your account expire from
non-use and your not joining the new system)...maybe they will
figure out a way to accommodate everybody and still make
enough $$$$ to keep themselves happy.

>whatever you pay for your hourly downloads...

Yeah, that is the position I find myself in. $4.95 seems like a
trivial amount, but over the course of the year it means you're
basically paying GEnie $60 extra in addition to what you're
normally paying for your connect time. What a shame. I've
been on GEnie since 1987...oh well...

>
>If the only reason you ever call GEnie is to go into the Religion RT, or the

>Horseman and Three Pedestrians of the Apocralypse.'" - Sourcery

The same thing happened to me after about 3 months. The battery is soldered
in, but it is easy to replace. I bought a battery holder of the appropriate
size and de-soldered the old battery and replaced it with this new holder.
Be sure you get the polarity correct. Luckily the holder will fit
in the space provided overtop the IC. I don't remember the details
on the holder or the battery #, take the battery to some electronics place
and ask there. I got my stuff here at Fry's - our local electronics
supermarket.

1710. Re: SIMMS, 6888#s - STe

Newsgroup: comp.sys.atari.st
Date: 1990-09-09 17:56:40 UTC
From: ekrimen@csuchico.edu
Message-ID: <1990Sep09.175640.22681@ecst.csuchico.edu>
Source record: 238828

- I ordered my 1040STe today!!! and I plan on popping in memory as
- soon as it gets here. I beleave that standard 1 Meg x 8 SIMMS will
- pop into the machine and you have at most 4 banks of them. Does the
- 1040STe generally come with 4 banks of 256K memory chips or does it
- have one bank of 1 Meg chips? i.e. do I have to order 4 megs of
- chips or only 3? Do I have to wait and see?

They come with 4 banks of 256K SIMMs. Due to the hardware, it's
impossible to have one bank of 1 meg SIMMs. (Although I know some
clever German will come up with a fix for it. :^)

- The STe can't take the 4 Meg chips right? (Do 4 Meg chips have
- more pins?)

I don't know if there's any pin difference, but the MMU can only take
4 megs and you can't have just one bank anyway. (Then again, I'm
sure a clever German will fix this.)

I tried pulling out SIMMs and it's really hard if you've never seen
anyone do it before. Just pull straight up from one side a little to
loosen it and then from the other to pull it out completely. After
you do it, and pop it in again, you'll be surprised how easy it is.
It takes a bit of strength. Does anyone know if there's a chance of
the socket coming out as well? Those SIMMs are really tight!

*** On a related note, does ANYONE know where to get SIMMFIX, the
*** small AUTO folder program that allows 2.5 megs in an STe???

++ Has anyone thought of putting a version of Sozobon
++ [(or gcc) set-up to make Atari executables from a Sun] on
++ atari.archive, or anywhere else. It would be helpful.

I have a gcc cross-compiler on a Sun. Trouble is, there's some hard-coded
directory paths which make a compiled version not terribly portable. I guess
that's why jbammi only distributes source code.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Lately, my 520ST has been havng problems. The screen begins to show garbage. It seems like the memory is being corrupted because the mouse will be going and the garbage is still on the screen. What happens is the pixels in the even columns (of a mono screen) get garbled. The end result is a screen of clean columns and dirty columns. The dirty columns also show bands of white and black. I suspect this is a memory problem because the garbage shows up on byte boundaries. Could it be that one bank of SIMMs is not being refreshed properly?

This is my system:
520ST circa 1986
JRI RAM+ with 2 meg simm (total 2.5 meg)
2 external floppies
1 hard drive w/ ICD controller
1 modem, 1 printer

1724. Where do I get TurboAss

Newsgroup: comp.sys.atari.st

From: micro@imada.dk
Message-ID: <1990Sep10.141343.3127@imada.dk>
Source record: 238844

Hi
I have heard much about the shareware assembler 'TurboAss' (or something).
It should be fast as hell, and have a very good debugger... But why is a
thing like this not on a popular ftp-site??? (isn't this in the interest of the
programmer?).

Is there a good german anonymous ftp site which we should hear about? (eg one
with the about program and other goodies).

Klaus (micro@imada.dk)

1725. Thanks for all replies! And more problems ...

First many thanks to all those who replied to my question about the dead monitor! I finally brought it to an Atari dealer in Long Island (Island Computer) because I was around at that time (two weeks ago) and asked them to take a look at it. They did more (without asking my approval!): they replaced two capacitors (I don't remember which ones) because they were going to fail or something (I know they hadn't blown up because I smelled nothing when I opened the case). That costed me $64 and change (mostly labour, I guess). I probably should have looked into the Atari replacement policy ...

Anyhow, when I came back my monitor was fine but I found another problem: my hard disk (SH204, 20Mb) has what I suspect is a blown fuse. I have no idea how that happened. When my monitor went bad I couldn't park the heads in the hard disk but that shouldn't have affected the electrical stuff inside (I guess). And I boxed everything right away and stored them in a (somewhat damp) garage for a week. And when I reconnected everything I found the blown fuse (I am not sure whether it was blown before reconnecting or was something that I did, but I certainly didn't hear any popping sound ...). Has anybody had to change a fuse in one of those boxes? I would appreciate any help!

I also have some more questions, like: what is the (if any) 800-number of Atari? Does anybody know of an Atari dealer in the Princeton area, or in New Jersey for that matter? I tried calling a number in the back of a December '89 Atari Explorer but it has been disconnected.

As always, thank you very much in advance! I hope I can contribute something more than problems to the net!

Hey Netters,

I have a handfull of questions about STe, mega, and this TT machine. I am shopping for a machine that can be both a heavy duty number cruncher (I am doing research in large scale neural nets) and a good home/hobby machine. I went to a local dealer here in Houston and although he was helpfull, I need some more, in depth answers to some questions. Sorry if these have been asked before but I hvae been reading this group for a couple of weeks now and I havn't seen any answers yet.

1) My dealer made it a point of telling me that the Atari machines all had a "load of support chips" but the only one he could tell me about was the MMU. What other support chips are there on board and can a math co-processor be added?

2) What technical docs are available for the Atari machines? To what extent do they cover the various machines?

3) What is the price of the Developers Kits for each of the machines? What compilers/debuggers do they use. My code will most likely be in C but a pascal compiler would also be nice. A good debugger is also a must.

4) What bus in in the new TT machine. How many slots will be open after a standard configuration of a color monitor and a hard disk?

5) What about network products so that I can talk to my PC clone?

6) Can a multi-sync monitor be connected to Atari machines? The 12 inch monitors that I saw in the store would drive me crazy after my 20 incher at work.

If you reply by e-mail, I'll summarize (no need to burn bandwidth on repeated answers).

Thanx in advance,

The battery in my Supra disk also went very quickly. I contacted the
UK importers, Frontier Software in Harrogate, (from whom I bought
it) and they supplied a new one free of charge. A friend with a
soldering iron fitted the new one. The new battery also failed very
quickly and I phoned Frontier again. They recognised that this was a
common problem and this time they sent another battery plus
replacement (clock?) chip, also free of charge. I've had no further
trouble and was very happy with the response from Frontier.

IT IS NOT THE BATTERY!!!! There was a huge batch of SUPRA clock chips which are BAD, and killed the battery quite quickly. You need to send your hd back to SUPRA, where they will replace the chip with one that works, for FREE. I had this done and my clock chip works great now.

Source record: 238752

The CDAR-500 has been around for quite some time. But the
main problem was making up a 550 megabyte disk of software for
the CD to use. What use would the CDAR be without software and
Atari didnt know what to fill the disk up with so know they have
a new program called softsource that developers are sending in
their demos so atari can make up an official CD rom disk. More
info can be found on the front cover of ST informer Sept. Issue.
There have been several writeups for the CDAR in European
magazines like ST World etc. Many CDARS can be found at main
dealers across North America but CD's are harder to find. As a
developer I can buy the CDAR it is listed at about 895.00 Canadian.

We would love to put the new desktop in the above machines.
Unfortunately, we don't have enough ROM space to fit everything together.
Just for your information, the new desktop is 22k bigger than the old one.
Anyway, we may need a little bit more time or even a miracle in order to
squeeze every extra bits into the 192K ROM. We will try!

>Uh, right, but where do I find one of these Motorola offices?

Please pardon me for giving the snotty answer first, because it can be incredibly useful: You find ANY major company's phone number in the Thompson Register (It's a set of about 15 big green books in the reference section of a lot of libraries, and in many purchasing offices).

Now for the nice answer: Motorola has a headquarters number of (708)397-5000. One number for the tech people is (708)576-7000. Those are Illinois numbers. The home of the 68000 is in Texas somewhere. Again, good general advice is that any BIG company will have a number in any big city phone book. If I didn't want to walk through from the main corporate number, and the 576 number wasn't local (it IS local for me. I'm sure it isn't the final number in a game of 'phone tag, but it's a good start for me), I'd check the Dallas and Houston phone books.

1738. CPMZ80 and TOS 1.4 - A Fix

Newsgroup: comp.sys.atari.st
Date: 1990-09-11 04:13:08 UTC
From: os9paul@gkcl.ists.ca
Message-ID: <12318@ists.ists.ca>
Source record: 238754
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

The CP/M emulator from Atari DOES work with TOS 1.4, but it does require
a minor patch.

On the TOS disk, rename the file INIDSK.COM to INIDSK10.COM (it works
with TOS 1.0 and TOS 1.2). Copy CPMDATA.DAT to CPMDATA.BAK just in case.
Using your favorite disk editor, you must change one byte in CPMDATA.DAT.
Locate cluster 19 (aka sector 38). This begins with the hex sequence
31 DA 03. At offset B8 the original byte is 08; change this to 00 and
save the change. Or you may search the file for the sequence of bytes
7E FE 08 20 0C, and change the 08 to 00.

That's all there is to it. The file CPMDATA.COM actually contains the
information for the TOS directory on the CP/M disk, the CP/M directory,
the files INIDSK.COM and TOSCPM.COM. The byte that must be changed is
actually in INIDSK.COM. If this byte is not changed, any attempt to
initialize a freshly formatted disk will cause the dreaded "Disk is not
empty" error.

Code fragment for techie types:

```
...
LD HL,#008B ;byte just after first filename.ext in directory
LD A,(HL) ;this byte is 00 with freshly formatted TOS 1.4 disk
CP #08 ;must have been 08 with older TOS versions, make 00!!
JR NZ,1C7 ;display "Disk is not empty"
...
```

ASSORTED NOTES:
The version of the CP/M emulator that I am using signs on as follows:

```
CP/M-Z80 Emulator Copyright (85) SoftDesign Munich
Release 9.4 Version 7 for ATARI TOS
```

I followed the directions in the READ.ME file to create a single-sided
PSEUDO CP/M disk. I then formatted a double-sided (720K) disk under
TOS, started the emulator by double-clicking on CPMZ80.TOS, and
inserted the SS CP/M disk when requested. Then I used the command
'inidsk b:' to initialize the 720K disk. I used TOSCPM.COM to copy
all the CP/M files from the TOS disk to the 720K CP/M disk.

Two drives are required to set the emulator up, but after that it will
work just fine with one drive. (Note that scopy may be used to do
single drive copys from one CP/M disk to another CP/M disk.) If you only
have one floppy and a hard drive it is still possible to create your
CP/M disk. Make a CPM folder on the C: partition of the hard drive and
copy all the CP/M files into it. Open the CPM folder so that it is

active. Now open A: and run CPMZ80.TOS from it. Insert your CP/M disk into A: when prompted. Use the command:

toscpm c:filename.ext filename.ext

to copy each file to the CP/M disk. Do not use a backslash after the c: and all will work well.

BTW, when you run MAKE_ME.TOS and it prompts "Press any key...", it actually means "Press any key provided it is marked 'Return'". :-)

Is it possible to connect more than one SCSI device to the SH204 host adapter?

I have tried the following, but have not been able to get the computer to recognize more than one drive at a time:

Setup one:

SH204-----Seagate 251N-----Adaptec4000A=====Seagate 251 (LUN 0)

Setup two:

SH204-----Seagate 251N-----Seagate 225N

Perhaps I am mistaken about some aspect of how SCSI works, but I thought that I should be able to use setup one and have the 251N as DEV 0, LUN 0 and the Adaptec/251 as DEV 1, LUN 0.

Has anyone been able to connect more than one SCSI device or intermix imbedded drives with Adaptec controllers? Is this possible with the SH204 host adapter or must I buy a different flavor? Any ideas about wht I may be doing wrong?

TECH INFO: The SH204 host adapter has the ADE PAL installed. Hard drive software is Supra 2.72; TOS is 1.4.

Well, after all there's a ROM port with an extra 128K of ROM address space.
How about a solution that involves this space? Then you would also have enough
space to add GDOS to the TOS ...

Source record: 238758

I really HATE to bring this up, but several people responded to me
and I lost their response when my mail-sorting program ate their letters.
Anyhow, I tried everything suggested (shining the white into the shadows)
and it responds with ....

'The dragon says, "Since I'm unable to see anything else, I'll just
eat you"'

or some such nonsense. I've tried putting the white into the teapot to make
a lamp, I've tried shining it through the prism (what IS that damn thing for
anyway???) I've tried covering it to make it dimmer, all to no avail. I've
even succeeded in knocking the 'shapes' (hobbits or whatever) unconscious,
but I *still* can't move them. Heck, I even tried throwing the heads at
them to scare them out.

WHAT IS GOING ON HERE? The Pawn is a generally enjoyable game -- it's just
so darned technical in places it ruins the playability!

>1) My dealer made it a point of telling me that the Atari machines all
>had a "load of support chips" but the only one he could tell me about
>was the MMU. What other support chips are there on board and can a
>math co-processor be added?

In an ST of any brew (not TT) there are a number of custom chips: The MMU looks after all the memory management; The SHIFTER deals with video output, colour pallet etc; The GLUE chip holds the whole system together; a yamaha sound chip; a DMA chip used by the DMA port and the floppy drive; Various ram and rom chips; a M68000 processor clocked at 9Mhz and the BLITTER chip fitted in some machines performs fast memory block moves using DMA (Direct memory access.) The STe varient has much better graphics ability and easally expandable memory (due to the use of simms), the better graphics is due to an improved SHIFTER chip. None of the standard keyboard ST's can have maths coprocessor added as standard but there are companies that offer processor accelerators (a 16Mhz 68000) that can replace the standard 68000 and I think some of these have a socket for a 68881 maths coprocessor. Now for the mega ST, this beast is very similar to the standard Keyboard ST (ie. no STe features). The Mega range are actually seperates with detached keyboard but more importantly they have one internal expansion bus (yes Atari specific I am afraid.) One of the cards available for this bus is a coprocessor card.

The TT is a much more recent concoction, indead it is not readilly available yet. (Will be available in about 4 weeks here in the UK). This machine is about an order of magnitude more powerfull than the current ST range and uses a M68030 CPU clocked at 32Mhz. The machine also comes with a M68881 maths coprocessor as standard. This co processor is socketed and can be replaced with the faster 68882 copocessor.

>2) What technical docs are available for the Atari machines? To what
>extent do they cover the various machines?

The developers docs are very good but expensive, there are a few
excellent books that describe the machines amicably (The compute
series is of note).

>3) What is the price of the Developers Kits for each of the machines?
>What compilers/debuggers do they use. My code will most likely be in
>C but a pascal compiler would also be nice. A good debugger is also a
>must.

The developers kits here in the UK cost 195pound +vat, I belive it is
actually cheaper in the US. If you have lots of memory and are UNIX
fluent you may like to try out the GNU compilers GCC, G++, SMALTALK
etc. these have a wide range of tools proted including GDB, GPROFF,
etc. oh yes EMACS is available also. On the comertial side I use
Lattice C Vsn 5, this is an excellent development envirtoment and the
code produced is very nippy. Prosporo also do a good set of compilers.
As a note I was not impressed by the compilers included in the
standard developers pack. An extended developers pack includes the
Mark Williams C compiler (NB. This is not ansi compatible like the
others mentioned above.) but a good system non the less.

>4) What bus in in the new TT machine. How many slots will be open
>after a standard configuration of a color monitor and a hard disk?

The TT actually uses a standard VME bus of wich there is one in the
current version of the TT, It should however be possible to extend
this to a full backplane if desperatly required. The hard disk uses a
SCSI bus, and thus it is also possible to connect 7 more SCSI devices
to the controller. As a note the Hard drive included on the TT is a
40meg 28ms device. Generaly the TT is a very nice machine and should
run most of the ST software, it does however cost much more than the
basic ST.

>5) What about network products so that I can talk to my PC clone?

The cheapest way I have found to transfer data between the ST and a PC
is to take a PC formatted disk and use that to transfer the data. The
ST will read and write PC disks, the STe can not only use these disks
but can also formats disks in a PC compatible way. The other method I
have used is to use a serial link on a fast PC, this is actually very
usable since the ST can easilly transfer at 19600baud. If you are
rolling in mony ethernet is available (here in eourope at any rate.)
On the TT front the machine comes as standard with 4 serial ports, one
of which is compatible with appletalk as used on the mac.

>6) Can a multi-sync monitor be connected to Atari machines? The 12
>inch monitors that I saw in the store would drive me crazy after my 20
>incher at work.

Yes you can, but the resolution will not change (there is a mod that
can use the extra space for more pixels called overscan which you may

wish to check this out). A 19inch mono moniter can be used with the mega series if you have the many $$$ it takes to purchase the item. BTW, I actualy find the small 12inch mono moniter from Atari excellent, It would have been nice to have it in a 14 inch variety but since it scans at 70Hz it causes vertually no eye strain. The other advantage of this mono is that it it is crystal clear since the image does not have to go through a colour mask. If I wish to use a colour mode then I simply use a Portable TV to play that odd game on. One final note on the use of TV's the only ST's with modulators are either the STe or any keyboard ST with the letter m after the memory size. (ie 520STe, 1040STe, 520STfm, 1040STfm are the models with a modulator.) None of the mega range has a modulator nor does the TT. (These machines are aimed at the bussiness market.)

>If you reply by e-mail, I'll summarize (no need to burn bandwidth on >repeated answers).

In short I am very happy with my ST (2meg STe, 65Meg Harddrive, mono moniter and a telly.) and may purchase a TT if I win a lottery. I know the machine is populor here in europe but less so in the states. Whatever you choose good luck and think carfully.

Hope I have helped rather than confused, if you require any more info please email me at your leasure.

>Just for your information, the new desktop is 22k bigger than the old one.
>Anyway, we may need a little bit more time or even a miracle in order to
>squeeze every extra bits into the 192K ROM. We will try!
^^^^^^^^^^^^
What about the STE, Derek? There was no mention of that. I was just
wondering if you'll be trying to put the new desktop in there?
It's got a 256K ROM with about 30K spare, as far as I know.
That sounds about enough space, doesn't it!!!

I suppose that with this new policy of Atari's, if you're busy coding up
the new STE desktop, you won't be able to let us know 'til it's finish and
shipping. Right? :-)

Keeping my fingers crossed...

Dougie.

> Anybody have an idea where to get a 68881 or 68882? The magazines I flipped
> through (Byte, Comp Buyer's guide, STart) didn't have a single listing. What
> are the different FP chips that work with the STe and how much do they help
> with intense double precision calculations?
>
[Stuff obviously deleted]

Are you under the assumption that a 68881 or 68882 will fit into the STe?
I don't remember seeing an advertisement saying that the STe had such a
slot, and I don't remember seeing one inside my STe...

And by the way, I ACTUALLY tried to put 4 4Meg SIMMs into my machine,
and had unpredictable results, sometimes I had 2 meg, sometimes I had 4 meg,
But NEVER did I have 16Meg. (I was using 4meg x 9 SIMMs, but that shouldn't
matter that I did't have 4meg x 8)

Yup, I like it very much. But I wonder from your message does that mean
the TT is ready? (Note: question not really directed to you Alan just
more towards the air :-)
Thankfully, the one thing my Atari has taught me is patience.
BTW, the desktop really sounds great! The TT seems to be shaping up
very well!

1752. Re: SIMMS, 6888#s - STe

Newsgroup: comp.sys.atari.st
Date: 1990-09-11 14:12:28 UTC
From: hardware@rose.uwaterloo.ca
Message-ID: <1990Sep11.141228.9957@watdragon.waterloo.edu>
Source record: 238767

Simm boards on an STE are usually paired so that you could take
out two of the 256k boards and replace them with two 1 meg simm boards
to get 2.5 Megs on an STE. There is some software that is supposedly
required in an auto folder to recognise the extra ram. 1 Meg simm boards
can be bought fairly cheap in Toronto some for under 100. I have heard
it accepts both 8 and 9 pin simm boards.

On a more useful note! Any ST can now upgrade via the Simms due to a
new circuit board designed to plug easily into your existing ST! It
can be purchased at TRIFORMATION call collect (818) 363-1004. The board
cost $119.95US and uses power from your disk drive and fits nicely
between the disk drive and your power supply. If you havnt upgraded your
memory yet this would be the best way to go because when you sell your
older machine you can always take the simm baords with you to your STE
or IBM(if you think thats an option). Its called the SIMMS Upgrade board
by JRI Technology.

>had a "load of support chips" but the only one he could tell me about
>was the MMU. What other support chips are there on board and can a
>math co-processor be added?

There are many support boards available for the St and TT. Mainly
IBM AT and XT boards which turn your ST into a IBM. On some STs
blitter chips can be added if they are not installed to improve screen
refreshing. In germany many upgrade boards exist for Colour enhancement.
On the TT there is one slot for the VME bus. It could be used for many
purposes. On the TT there are a number of extra ports ready for LAN,
SCSI,RS232 etc devices.
>
>2) What technical docs are available for the Atari machines? To what
>extent do they cover the various machines?

Technical docs written by abucus are sufficient but not thorough in
describing TOS and support chips. A good book would be to get
The Concise Atari ST 68000 Programmers reference Guide. $35.00
As a registered developer the documentation is more indepth but
could be improved to cover missing areas.
>
>3) What is the price of the Developers Kits for each of the machines?
>What compilers/debuggers do they use. My code will most likely be in
>C but a pascal compiler would also be nice. A good debugger is also a
>must.

The price of the Developers Kit is around the 200-300 range. The docs
can be fit into two large Binders describing TOS,AES,ETC. The TT
developers kit isnt complete yet. There are many many C languages and
compilers out for the ST and coming out for the TT. Mark Williams C is
soppuse to be the one most registered programmers use. ICD has a personal
pascal available and there are others around as well. There are many
good debuggers out for the ST too. They are to be ported to the newer
TT with faster code improvements for the newer Microprocessor.
>
>4) What bus in in the new TT machine. How many slots will be open
>after a standard configuration of a color monitor and a hard disk?

The TT spec sheet is handed out at many atari dealers just ask for one.
It handles a VME bus expansion slot. The colour monitor and hard disk
dont require use of the VME(correct me if im wrong)bus slot. The
colour monitor is an improved version of the 12 inch older monitors.

>
>5) What about network products so that I can talk to my PC clone?

There are ethernet cards out and available through Germany. Cost
is a factor though. The TT will have a new LAN network available if
someone designs one for the TT. It shouldnt be that difficult.
You can always use the RS232 port at 19200 baud for communication
to your IBM. Many are doing this with the ST now.
>
>6) Can a multi-sync monitor be connected to Atari machines? The 12
>inch monitors that I saw in the store would drive me crazy after my 20
>incher at work.

Yes any GOOD multisync can be hooked to the Atari Machines. I have a
14 inch Electrohome Model. My father has a 29 INCH Electrohome model.
Model numbers are ECM1310,1311,1312 for the smaller models. Your 20
inch most likely canbe hooked up if its can sync properly at 60 or
50Hrz. Mine can handle both easily. All resolutions can be handled on
multisync monitors which is an added bonus. To get monochrome mode
on a multisync hook line 4 on the monitor port to ground by using
a switch on the ST models.

That would be here in Austin. The number you could call to get info would be: (512) 891-2000. Don't know which office that is. You could try the general number (512) 928-6000

The address is:
Motorola
1 Texas Center
Barton Springs Rd.
Austin, Texas 78704

I guess you can put what department it should go to, that's a big office building. The suite for the staff services is #400, but call the 2000 number and they will tell you whatever you need to know or who to get in touch with.

Avant Garde offered PC Ditto II to those who had the original PC Ditto program and were registered users a deal on the PCD II. With the special coupon send by them, PCDII only cost $150, which is much less than the other pc boards. Now all that ordered one when it came out are receiving their boards and now the plethora of problems is arising.

(yep, I got hit too, my cables are bad and need to have new ones made...)

Someone just convinced me that it might not be such a good solution to put it in the ROM port space because of copy protection problems and more. So how about an official RAM version of the desktop that loads from the auto folder and replaces the TOS 1.4 desktop? How big is this desktop anyway? If people are willing to use up RAM for NeoDesk, Gemini and alike, why not for an official Atari replacement (which I believe is smaller that those other ones)?

This is a pretty common problem with upgrades and has to do with ringing on the CAS lines to the extended ram board, a couple of 33pf capacitors on the end of the two CAS lines on the expansion board will probably work wonders.

> It should be fast as hell, and have a very good debugger... But why is a

I never heard of it, but I know of one commertial assembler which
I use on regular basis. It's called DevpacST and it has a VERY good
debugger and other utilities (linker, libraries, etc). One commercial
assembler you should stay AWAY from would be AssemPro. The thing is VERY
buggy and I haven't gotten much use out of it...

BTW: DevpacST retails for about $65...

>

Thank you for all the people who suggested different ideas of how to
squeeze the new desktop into the ST ROM. Someone suggested to use the cartridge
port and most of the others suggested to put it on the disk. Technically, they
are all O.K, and I will reflect all the opinions to management people.

As of today, I believe the STE will have the new desktop.

Hey, netters!

In a recent posting by John Henders, he listed a lot of books for the Atari ST. One caught my eye-- "Learning C. Programming Graphics on the Amiga and Atari ST" by Marc B. Sugiyama and Christopher D. Metcalf.

I am in the process of learning 'C' this summer, and am taking an upper division computer graphics course starting in a few weeks at my college. This book sounds like something that I'd be interested in, but I hesitate when the book also deals with another computer.

If anyone out there owns this book, could you please tell me how much of it is dedicated to the Atari, and what sort of graphics it deals with? .RSC files? Fractals? 3-D modeling? Simple stick figures? Animation? Curious minds want to know.....

Thanx in advance,

Sounds like you have one of the [not very many] STe machines with SIP modules (with the pins). I don't think you will pull the socket out.

Most STe's appear to have SIMM modules which can be released by unlatching the small hooks that hold them in place - but be *very* careful not to snap them off as they are only plastic.

Sounds like MultiDesk from CodeHead S/W.
I like it. I load it with an empty set of ACCs. Later you
can add whatever you need without rebooting.
Haven't found any ACC's that fail, nor had any problems
with the software.

Atari hasn't had an 800 number in years, the bean-counters who run the place decided they weren't cost-effective. They do have a toll (heavy toll from New Jersey, where I used to live too) number, but I can't remember what it is. Try calling California information --- area code for CA+ 555-1212. I think it's also in some of the ST documentation.

Re: Programming Graphic on the Amiga and Atari ST.

The book deals with 3d graphics mainly and works with a shared library between the St and Amiga. There are enough typo's in the code to make sure you really do learn coding.;^)
There's an interesting z-buffer variation and the hidden line algorthm is interesting. I wouldn't pick it as a book to learn C with(which it purports to be),unless you're already proficient in another language.

Quick ST II version 2.2
=======================

- faster!
- new features!
- 68030 compatible!
- new phone numbers!
- newsletter for registered users!
- German language version in Europe!
- expanded credit card and shipping support!

Price: $19.95 U.S.

Branch Always Software
14150 N.E. 20th Street, Suite 302
Bellevue, WA 98007 U.S.A.

Order line: (206)-643-9697 (10am to 6pm Pacific Time)
FAX: (206)-643-3844 (24 hours)
Telephone: (206)-885-5893 (24 hours)
Compuserve: 73657,2714
GEnie: DAREKM

This is to announce that an update to our popular screen accelerator, Quick
ST II version 2.2, is being released this Friday, September 14, 1990. It
will be on sale at the upcoming Atari shows in Glendale and Washington.
Quick ST 2.2 will go on sale at dealers across the U.S. and Canada in
October. A German version will also go on sale in Europe. Existing
registered users of Quick ST and Quick ST II can upgrade immediately.

Features:
---------

Quick ST 2.2 is a software screen accelerator. When used on any Atari ST,
Atari STE, or Mega ST, it speeds up the text and graphics operations on the
screen. Almost any text or GEM based program runs faster as a result,
making your ST perform like a much faster machine. No hardware
modifications are required. And the ability to install custom background
patterns and pictures is included!

Quick ST 2.2 is very memory efficient, using less than 30K of memory for
the standard version, and less than 20K for the 2.2G version (also
included). An extra 32K of memory is required for background pictures.

Quick ST 2.2 is fully compatible with hardware accelerators, such as the
T16 accelerator from Fast Technologies, the Blitter chip, and even the
68030 chip. When used with a hardware accelerator, Quick ST 2.2 provides a
```

speed increase on top of the speed increase of the hardware accelerator.

Quick ST 2.2 has a number of improvements compared to Quick ST 2.1 and earlier versions. Some of the new improvements include:

Support for the ISAC graphics card (which gives a screen resolution of 1024x768 pixels in 16 colors). Moniterm monitors and Overscan modifications are still supported, as is the MonSTEr emulator (in all 3 screen resolutions).

Blitter support for faster screen scrolling, and it now checks the status of the blitter chip to see if it is disabled. This allows Quick ST 2.2 to run on machines with defective blitter chips.

GEM line drawing and rectangle fills are even faster than before.

68020/68030 accelerator board support is available on a second disk for $10 more. Quick ST 2.2 also supports the original 3 graphics modes on the TT. Full TT support will be available in Quick ST 3.0.

The Desktop Customizer now allows you to temporarily disable Quick ST 2.2 from the menu bar, for easy "before" and "after" speed comparisons. We found this feature handy when demonstating Quick ST 2.2 at the recent World Of Atari show in San Jose, and you will too.

Several bugs have been fixed with Word Up 3.0, Laser C, Opus, Wordflair, GFA Basic 3.0, and other programs. Two bugs relaeted to the fast GDOS font drawing are fixed. First, a bug that caused Word Up 3.0 to occasionally display garbled text when scrolling is fixed. And outlined GDOS fonts now get drawn correctly on a color monitor.

The Quick ST 2.2 package also includes the MonSTEr high resolution monitor emulator, the Quick Index benchmark utility, Quick View, and of course, the Quick ST II Desktop Customizer.

Starting in November, all registered users of Quick ST II and Quick Tools will receive a periodic newsletter which gives information about updates (such as Quick ST III), tips for using the software, answers to commonly asked questions, and other information. To receive the newsletter, you MUST fill out and send in the registration card that came with your Quick ST II or Quick Tools software.

How to order Quick ST 2.2:

Quick ST 2.2 can be ordered directly by credit card (VISA, Mastercard, and Discover) through Xanth Corporation. Various shipping methods are available, including UPS, DHL, Express Mail, and First Class Mail. Call the order line between 10am and 6pm, Monday to Friday. Most orders received before noon will be shipped out the same day. Shipping charges will depend on the shipping method chosen and the country being shipped to.

If ordering by mail, send a check or money order for $19.95 + shipping ($3 in Canada and the U.S., $5 elsewhere) in U.S. funds and allow 3-4 weeks for

delivery. Make all checks payable to Branch Always Software. No C.O.D's.

How to upgrade to Quick ST 2.2:

To upgrade to Quick ST 2.2 from an earlier version we MUST already have your registration card. Take your original Quick ST or Quick ST II disk, include the appropriate update fee, and mail it to Branch Always Software.

Please note the new upgrade prices:

$3 - If you purchased Quick ST 2.1 after August 31, 1990. If you did not purchase it directly from us, include a copy of the receipt showing the date and dealer name it was purchased from.

$5 - If you are upgrading from Quick ST version 2.0 or 2.1 and live in Canada or the United States.

$10 - If you do not live in Canada or the U.S., if you are upgrading from Quick ST version 1.8 or earlier, if you lost the original Quick ST disk, or if it is inconvenient to send the original disk.

Sorry, if we do not have your registration card, we don't know about you and you cannot upgrade and you will not receive the newsletter. So dig up those Quick ST packages and mail in the registration cards folks!

NOTE: $5 off discount coupons which appered this summer in various ST magazines we valid for purchasing Quick ST 2.1 only, and cannot be used to purchase Quick ST 2.2.

Quick ST III

Rumors of Quick ST III (a.k.a. Quick TT) have been circulating for a while. It was our original intention to write a new TT compatible screen accelerator to take advantage of the 68030 chip and the new TT graphics modes and have it released at around this time. That was based on original estimates on the release date of the TT in North America, which have now come and gone. So a decision was made to take some of the features of Quick ST III and
some badly needed bug fixes and make the Quick ST 2.2 release
for the ST computer. Quick ST III also runs on any standard ST, although it has much higher memory requirements and a hard disk is recommended. Until we have a better idea of when the TT will be available, what the ST market will be like a few months from now, what sort of new hardware (i.e. accelerator boards or new ST models) will be available, consider Quick ST III to be vaporware. Please do not phone us asking when it will ship or for more information about it. When we decide on a release date, which will probably not be until at least the end of the year, that information will be sent out in a newsletter to all registered Quick ST II users. For now, enjoy Quick ST 2.2!

Split the whole thing into a mandatory part located in ROM and an optional
part to be loaded into RAM on startup.

> with?

I had the book for a while a couple of years ago. The main focus is on graphics primitives. The programs are designed to run on either machine, with a machine specific object module for the Amiga and for the Atari ST. If memory serves, there were a number of graphics primitives created, from simply putting points on the screen to moving graphics objects. The C supported at the time was Alcyon C, with modifications for several other C compilers which were popular at the time (lots of IFDEFS...) Most of the machine-specific code revolved around the Line-A routines, if memory serves.

Once you got the machine specific stuff coded and and object module generated, it didn't make any difference what machine you were using.

Things NOT covered: use of resource files (not really used in Graphics Programming anyway), VDI and AES routines (the Compute! books deals with these in sufficient detail for rudimentary Graphics Programming, though).

>>
>> As of today, I believe the STE will have the new desktop.
>> ^^^^^^^^^^^
>>
> Oops! the MEGA STE will have the new desktop, not just any
> STE. Sorry.
>

Interesting! If Atari now doesn't announce products until they're ready for shipping, and Derek has just let slip something about a Mega STE, then the Mega STE must be ready for shipping, right?

I WANT IT YESTERDAY! :-) (Sorry Allan - couldn't resist that.)

In fact, I probably don't want it, as it probably costs lots more than my plain ol' STE. I can probably even do without the new desktop if NeoDesk 3 is as good as it sounds. But maybe other people would like the option of fitting the new ROMs into their existing STEs. I might even like to do this myself, as I have the oldest (July 89) version of TOS 1.6. In fact, thinking about it..

I WANT TT ROMS RETROFITTED TO MY STE YESTERDAY!!

Oh dear, you've opened a can of worms there, Derek. We're never satisfied, are we? (Sometimes with good reason, though.)

Now, about this sixty-four/sixty-four machine someone mentioned...

:-)

Cheers,

Graham

Re: Turboss.
Someone on GEnie has TurboAss(or whatever it's called) and is getting the docs translated from German to English. Appearantly it's blindingly fast but doesn't support macro's. I don't know about anyone else but to me that makes it's usability close to nil.
I'd highly suggest shelling out the50US or so it costs to get Devpac2 from any of the major mail order places. It's a great assembler and no slouch in the speed department.

You know, I own an ST and have had it for a while now. I'm very happy
with it, it does what it needs to WELL. I'm tired of the lack of
support for it, however, and the attitude of Atari, so I am looking
into buying an Amiga. It is people like you, however, that make me
change my mind. Maybe I don't want an Amiga after all. Maybe, if it
will get me away from people who have to wave their computer around
like it is some sort of a phallice, I will buy an IBM clone instead.
Or a Commodore 64.

I feel so much better now.

1790. The TT is finally there!

Newsgroup: comp.sys.atari.st
Date: 1990-09-12 13:22:25 UTC
From: gemibusi@ztivax.UUCP
Message-ID: <1898@ztivax.UUCP>
Source record: 238728

The TT is finally there (at least in Germany)!
Monday evening (the 10th of September) too my surprise I saw a TT in
one of the shops of Munich that carry atari computers. The dealer told me,
that they really sell them now. On saturday they already sold one and the
customer left the shop with a TT and a smile on his face. That only to emphasizethat you
can really get one. They demonstrated Calamus for another customer
on the TT and a ST to show the speed difference. No wonder the TT was much
faster even though he only had no fast RAM. As I entered the shop just before
it closes I had no time for a closer look, so only a few informations. I hope,
I remember the numbers right, but I can't guarentee it. The configuration with
32 Mhz, 48 MByte hard disk, 4 MByte RAM and a color monitor costs about 7500 DM.You get
around 1.6 DM for 1 Dollar, but I think you can't calculate a reasonable
american price out of it, because the Dollar isn't doing very well against the
DM at the moment. I can't say anything about the new desktop, because I was
satisfied with Calamus for the moment, as I didn't know that there is a new one.

1791. 1040ST Floppy Disk Read Problem

Newsgroup: comp.sys.atari.st
Date: 1990-09-12 14:10:32 UTC
From: dmlewis@ac.dal.ca
Message-ID: <1958@ac.dal.ca>
Source record: 238709

1040ST Floppy Read Problem

We have a micro lab with 25 1040 ST's; the floppy drives have been replaced on some of these machines; the drives are from various manufacturers, but they are "Atari" drives.

When 25 newly formatted and copied Sony disks (using Dcopy19) were created they were only readable on about half the machines. A disk might be readable on one machine and not readable on another. When the failure to read occurred, the GetInfo response was "0 bytes allocated and 0 bytes available".

Help.

Allan,

Could you please go over the hardware specs of the new TT for all of us uninformed? Is the TT's cpu a 68030-33 running at 32Mhz? What speed is the memory system running at (16Mhz or 32Mhz)? What about the video improvements of the TT - could you tell us about the resolutions and palette? What is the different configurations and prices for the US of the TT? Thanks for any information you can come up with!

You forget ATari's #1 option. It does not have a $3000 price tag!
swood
PS. I don't need 4096 colors, as the most I have ever seen used is less than 128 even on DecStation gifviewers, and for less than you paid for your set up, I got an ST, a sequencer software, a MIDI workstation, and a Kawai K1 II. Giving me 8 channel Stereo Synthesis from 256 selectable waveforms, access to over 1000 pre-programmed sounds, a drum machine, delay and reverb effects, as well as song writing and performance ability - oh, not to mention full midi control of all my midi devices.

Gee, and I got a pretty good (not great, but pretty good) in the deal too. I guess it is all in the way you look at it!

BTW - cost break down

I got the cpu from a going out of business sale (it was out on loan for a repair customer for less than 2 weeks - but it came back on the last day they were open so they wanted to move it fast) for $250 (STfm +.5 M for a 1Meg of memory, + internal 756 k ds 3 1/2) BTW STfm includes a rf modulator, so it spared me a monitor cost. I then got a simple sequencer, a 3d graphics program, and a basic disc thrown in for free, as well as purchasing a $229 MIDI workstation for $50

The K1, and connecting MIDI cables/audio cables came up to about $650 Brand pankin' gnu

Thank you Petra for that unbiased and objective report on the respective features of both the Commodore Amiga and Atari ST. I'm sure I speak for all Atari owners when I extend my gratitude to you for sharing your views with us in such an articulate manner. I would like you to know how much we respect your views and how they will influence us in the future.

Dave.

OK, I found a .gif file veiwer by Zyphodyne, that seems to be using low
res mode for the scans. Anyone know what is the maxim dpi resolution for
the ST? I have all of these gifs that take up tons of space cuz I like
to veiw the resolution on the DecStations at school, but I would like to
shrink them to whatever may be the maximum usable on the ST
Also, are there any higher resolution veiwer besides teh Zyphodine gifshow?

I would be interested as well, as to the size that it is best to crop to...

From: rrd@hpfinote.HP.COM
Message-ID: <15330009@hpfinote.HP.COM>
Source record: 238715

Hello all,

I'm looking for a good computer repair shop in the Ft. Collins/Loveland/
Greeley/Longmont area (I could go to Boulder, even), to get my
1040ST's internal disk drive realigned.

We're in the process of moving to Loveland, and I don't know the area
well enough to find a place on my own.

Specifically, I need a shop that undesrtands about Spectre GCR and can align
the R/W heads on the drive so they read Mac disks correctly.

As a last resort, I'll call Gadgets By Small, but they're so overworked that
I hate to bother them on a trivial matter such as this. Please help?

Thanks.

1798. GNU fileutils 1.4

Newsgroup: comp.sys.atari.st
Date: 1990-09-12 18:18:57 UTC
From: roeder@sbsvax.cs.uni-sb.de
Message-ID: <6453@sbsvax.cs.uni-sb.de>
Source record: 238716

The new versions of the GNU fileutils (version 1.4) is now available for
anonymous ftp at cs.uni-sb.de [134.96.7.254] in directory pub/atari/tools.
The (trivial) patches for the ST source are in file fileutils-1.4-diffs. The
binaries can be found in pub/atari/bin. For differences to the old version
see also the announcement by David J. MacKenzie on gnu.announce.
The atari version differs in the following aspects:
- mkfifo is not supported (it says so when it is compiled)
- if you ask ln to make a hardlink it really copies the file
- mv of directories is supported only on TOS >= 1.4
- chmod is not fully implemented (we have no user-specific restrictions
in our OS)
- touch can of course not change three separate times (only the
modification time)

Try it and like it!

- Edgar

>We finally have access to the net. Questions, flames, requests welcome
>by email or news.
>
>"You must remember me... I bought a disk drive from you last month."

I bought I disk drive from you - I'll never forget you.

You advertise your Power Series 900 disk drives as STE compatible. They aren't.

Of course, most hard disk drives have had read/write problems with chips fitted in some STEs. This isn't your fault and has now been fixed by Atari.

What I'm talking about is the fact that rebooting my STe with your drive attached causes a bus error which can only be cleared by a further reboot.

Having to hover over the reset switch in order to reboot twice is not what I describe as compatibility.

I have called your 'Technical Support Line' (har har!) many times since I bought my STe and listened to many versions of 'the problem's being fixed' or 'we don't know what it is, and either do the manufacturers, GE-SOFT'. The favourite expression is 'it seems to be a feature of the board'.

In fact, copying Atari's AHDI.PRG onto my floppy boot disk in place of GE-SOFT's P_HDI.PRG fixes the problem, quickly, simply and without recourse to reformatting the whole drive. No need to spend four months looking at two bombs every time I reboot either.

This operation is so simple that I might have been tempted to try it earlier had I not been assured many times that 'it was a feature of the board' and 'it might need a new chip - we're working on it'.

On a slightly different note, I was told by you on Monday that sending my STE to my dealer for a new chip set would solve the problem. As proof that this was the correct thing to do I was told you were sending all the STEs you'd sold back to your distributors for repair. You even gave me their number. I was told by them (SDL?) that they weren't fixing any STEs because Atari had told them that all machines should be sent from the user directly to them. In fact, Atari told me that too. In fact, when I phoned you later that day querying what I'd been told, I was informed that the guy I had spoken to didn't know about the drive rebooting problem at all. Wouldn't it have been hilarious if I'd sent my STE away, got it back weeks later and *still* had to reboot twice!

All I can say is that if ignorance is bliss, you lot must be swimming in it.

Perhaps you should stick to selling blank disks.

Lots of luv,
Mark.

I've just send SBT6PACH.LZH and ACC11.LZH to atari.archive. I sent SBT6PACH there before, but someone said it wasn't there. ACC11.LZH, which is in the SuperBoot docs, lets you load desk accessories from a ACCS folder. SuperBoot recognizes this.

And SBT6PACH is a patch for SuperBoot 6.0 which allows you to enter Function Key names in lower case as well as upper.

> ... and a few others

To the best of my recollection, Flash doesn't recognize any of the VT100 AVO (Advanced Video Option) features, which most of those are. Are you sure about the inversed text, though? I recall using Flash with EDT a lot.

Flash basically handles the things that the plainest-vanilla VT100 would be able to handle, except for 132-column mode.

For a more capable terminal emulator, I would recommend Uniterm. It does a pretty good job with almost all the VT100 stuff, including a good hack for the 132-column mode (you get about 126). The VT220 clone I'm typing this on doesn't do as good a job as Uniterm. Also, it has Kermit built in, besides the BBS-oriented protocols. And the price is right.

> Also, does anyone know what the most recent version of flash is?
> I am using version 1.6

Can't help you there - the last version I used was 1.52 or something close.

At least one of our users has done this. I got a letter from a guy who was doing cross-compiles on VMS and downloading to his ST. There were (and probably still are) some gotchas to look out for when porting the Sozobon code to a host, depending on the word size and byte order of the host. But the code is pretty portable overall. If your host is enough faster than your ST and you have a reasonably fast link, cross-development could be a win.

Source record: 238724

Hi there poor ST users
im back again......
Firstly, the 520St cannot hardware scroll. It has to move each pixel
individually, alot like an Amstrad.
The 520 cannot produce 16 voice stereo sound through software.
It does not have Dynamic Hires- 4096 colours at 704*580.
It does not have a blitter chip that is used.
The AMIGA is now outselling the ST in England and America.
The Obese Agnus Graphics chip supports resolutions of above 1000*1000
The 520 can only produce sawtooth sound waves, not sine, or white noise etc.
The flickering of the screen in called Interlace and doubles the vertical
resolution of the screen. without this resolutions of 704*290 are available,
with it resolutions of 704*580 are available.
The ST can only use 16 colours in higher resolutions as opposed to 16,32,64
and 4096 on the AMIGA.
It is sick when the new ST `Amiga beater' just doesn't perform as well as
the Amiga. This also admits that the Amiga is a better computer.
The ST is only 10% faster than the Amiga however the ST does not have any
custom chips to carry out complex tasks and leave the 68000 for more pressing
tasks.
BYE
PETRA.

I'm still glad I bought an Atari and I'd buy another one if I could afford it. The fact is that the ST is the best MIDI workstation on the market. Not only that, it's the cheapest MIDI workstation.

I looked around for quite a while before I bought. Considering what I would be using it for and how much it cost, the ST was by far the best choice.

I'm not saying either machine is better than the other. They have different capabilities built in and it really just depends on what you plan on using it for.

>Quick ST 2.2 *sounds* good, but could we have some benchmark figures to
>see how much a speed improvment it gives?

Nope! I think enough literature has already been printed about Quick ST that
I do not need to supply it again. Numerous benchmarks of Quick ST 2.0 and 2.1
appeared on GEnie, Compuserve, Current Notes, PSAN, ST Informer, ST World,
and several other ST magazines. For me to post benchmarks could be viewed as
unfair. So instead I will ask you to check one of the reviews of QST 2.0 or 2.1
and then to the press release I posted listing the new QST 2.2 features.

Then again, if you really don't care whether your ST runs fast or crawls
(it's _your_ $1000 or $2000 investment) then don't bother. <grin>

Hi there, poor ST-bashing Amiga owners who lack a life!
I'm back for the first time, and I can even use appropriate punctuation...

Firstly, the life-lacking ST-basher cannot think before it posts. It
has to move each semblance of thought onto the keyboard individually
a character at a time, a lot like the proverbial room-full-of-monkeys.

The l-l ST-basher cannot produce meaningful sound, only volume.

It does not have dynamic personality -- silly numbers are incessantly
quoted instead.

It does not have a brain that is used.

(Must I drag it out to conclusion? I don't much like my ST anymore,
I may buy an Amiga some day, and even I'm tired of seeing posts like
yours -- most Amiga owners I know are far more sensible. We already
know what you've quoted. Go away, you pitiful waste of a social security
number...)

Funny last I heard all the Desktop stores that carried Amiga
products went into BANKRUPTCY. The entire chain went under and when
former employees asked for their commission money from Commodore for
selling Amiga junk Commodore spit in their face and gave them nothing.
If this is the kind of service you give to loyal employees I can imagine
the service you give to joe smoe. Also an entire chain of phase unlimited
stores across Eastern Canada went under sales were down across the board
for Amiga so dont come bragging about a company that has massive loans
to support a computer with no brain.

Oh while we are at it lets talk about the missing desktop. How come you
have to add a CLI to run everything on the Amiga?? Cant even make a
proper desktop. Who wants to type everything in to get things to run??? Now
Im back to DOS on the IBM which is outdated since 1985. How come the Amiga costs
almost twice as much as the ST? How come the icons are so huge you feel
your still sitting in front of a commodore 64? And lastly who paid you to
bother us in the ST area anyways?

I hate to waste bandwidth on this, because I thought it was self-evident, but apparently I was wrong.

PLEASE do not answer silly messages like the one from a person with the handle "PETRA." If you are concerned, send a message directly to the person. If you are more concerned, send a message to the sysop of the person's machine (root?), telling the sysop that this person is abusing Usenet's resources, in your opinion. The only way to keep assholes off the net is to freeze them out completely -- they're looking for attention, and if we don't give it to them they'll move on somewhere else, like maybe drinking ammonia or assasinating US presidents, the pre-Usenet methods of being noticed.

Let's keep comp.sys.atari.st for serious discussion. Otherwise, we are grossly betraying the trust of the institutions who pay thousands of $$ every year to distribute our ravings.

>more than a ST with a 68030 added on.

Chris, you're comparing apples and oranges. Things like the SLC generally cost quite a bit more in Europe than in the US. The TT is new, and we won't see what the real discounted price is until it's been available for a few months. You won't know what the TT price in the US is until it's released in the US. And so on.

The only person who knows what they want and what options are best and what price is reasonable is the person who's buying the computer, who has to make a decision based on their personal situation.

Or, you can ftp atari@archive and download the Dungeon Master maps for free. They are located in the /games directory, and there are three archived files: one with levels 1-8, another with levels 9-16, and the third archive has a list of all the spells. In addition, one of the three files (I forget which) has a listing of all the items that exist per level. The maps are all in Degas format. I don't know offhand what the name of the files are, but just enter "dir d*" in the /games directory and the names should be fairly obvious.

>the US is until it's released in the US. And so on.

I agree with (gulp, somebody alert the media!) you in that it is
difficult to compare the prices until the items are widely
available, but I don't think it is too far off the wall to base some
speculation on prices that we see now. Sure, there may be some
margin of error, but the alternative is to just not talk about
the system at all.

>The only person who knows what they want and what options are best and
>what price is reasonable is the person who's buying the computer, who
>has to make a decision based on their personal situation.

This is true. However, ATari has touted itself as the Power without
the price manufacturer, and judging by these recent prices disclosures
they have lost that title. What market niche are they trying to enter?
I don't get it. The machine's architecture is too closed to be of
any use as a workstation. The price is too high for a home computer.
There is no unix available to entice educational institutions to
buy them. There is scant network support. The company has a history
of leaving user support up to everyone else except Atari Corp so
businesses certainly won't give it a shot either. I am at a loss
to explain who they think will buy these hot rod STs. Other than
ST developers who would like a fast platform to write software on,
who would want one? I'm not trying to put the machine down mind you.
I wouldn't mind having one myself. I'm just trying to ask some
real world questions.

Also, one other observation...Any other company who had a new
product like this on store shelves would be promoting the
damn thing. Am I to gather that I have to hear 2nd or 3rd hand

reports on Usenet to know that the machine is for sale at stores
in Europe?? Apple,IBM,SUN,<insert vendor> usually has a big
media splash to announce new products like this so that people
become aware of that new product. Actually, they usually do
this BEFORE the product is available. How does Atari Corp.
expect to sell these things if only a handful of net.hackers
even knows of its existence? Again, I'm not trying to be
cynical here. This is a real world (TM) question that begs
for an answer. It is just such a damn shame to see such
products relegated to the computing basement because of the
bungling of the people producing the machines.

Anyway, nuff said.

>--
>"Perhaps I'm commenting a bit cynically, but I think I'm qualified to."
> - Dan Bernstein

Nothing wrong with a dose of cynicism. It's actually quite
useful in retaining one's sanity in a situation such as we now
have with ATC.

Cheers,

Chris

etc. etc.

Look, people have given plausible explainations for these things. It was argued, and no conclusion was arrived at. Why do you want to raise these questions again? No new answers will come out.

Let's not discuss this here.

[PS - if you don't recall the comments: (1) most workstations have as low of an expansion capability of the TT, for example the Sun SLC, which Chris himself compared to the TT. (2) A high price now doesn't mean a high price in the future, and some "power" home users are willing to cough up that kind of money to buy a new CPU for their existing peripherals. Well the TT succeed? Only the future will tell. Speculating now won't get you anywhere.]

>Anyway, nuff said.

Yeah, but the point of this quote is to show how Mr. Bernstein comments about everything under the sun, because he considers himself an expert on everything. Now we have you telling us whether or not the TT will succeed in the marketplace. Give it a rest, Chris.

If you want to reply to my PS, please do it in email. I am not saying I have *any* of the answers, just that arguing is useless.

In-Reply-To: message from edb762bbp1@vx24.cc.monash.edu.au

Thank you for this intelligent message concerning the Amiga vrs. the STe. I shall ignore that fact that you are wrong on a number of counts, about both the STe's and the Amiga's capablities. Perhaps you should educate yourself a little bit better about what the machines you post about can do.

Thank you for your support. Oh, and please, get a life.

.>Brad Martin<.

Cute tag lines on request.

1835. 1040 + GCR + 2nd drive = Mac ; (+ 2mb = Hypercard)

Newsgroup: comp.sys.atari.st
Date: 1990-09-13 21:18:55 UTC
From: kar7481@cuphub.cup.edu
Message-ID: <10181@cuphub.cup.edu>
Source record: 238746

I own a 1040stf (TOS 1.2) and a Spectre-GCR (v2.65).

I have found that while it IS POSSIBLE to **EXECUTE** Hypercard Stacks,
Hypercard simply **WILL NOT** let you use **ANY** of the EDITING TOOLS

---I was using my ST as a 832k system, but the EDIT BOX in Hypercard
was still unselectable...

I have also found that on an actual Mac Plus (1mb) , you CAN NOT CREATE
any Hypercard stacks(programs) because the EDIT TOOLS (again) are NOT
selectable.

Let me re-emphasize: YOU NEED MORE THAN 1-MEG TO ^WRITE^ ANYTHING
IN HYPERCARD!!!

I took my 1040 up to 2mb with the *** J.R.I. SIMMS upgrade board ***
I also had a second video shifter added too (socket on-board) and can enjoy
a 4096-colour pallate now instead of 512. Still 16 at once, but at least
its a TRUE 16-shade Gray-scale.

Again: Go To 2mb and buy a second floppy or a hard drive if you plan on doing
Anything with the GCR! A real Mac is also a bitch to work with
without a second drive(hard or floppy)!!!

1836. Re: TT desktop & prices

Newsgroup: comp.sys.atari.st
Date: 1990-09-13 22:05:19 UTC
From: mui@atari.UUCP
Message-ID: <2295@atari.UUCP>
Source record: 238747

in article <7739@neptune.inf.ethz.ch>, felner@inf.ethz.ch (Tomas Felner) says:
>
> In article <2283@atari.UUCP> mui@atari.UUCP (Derek Mui) writes:
>> We would love to put the new desktop in the above machines.
>>Unfortunately, we don't have enough ROM space to fit everything together.
>
> Derek, do you think you could elaborate a little bit on the new desktop,
> telling us about interesting new features that I have not mentioned in my
> 'trade show report' and give us more detailed info than I did? I believe
> that many ST netters would be interested. Thank you!
>
> Tomas Felner, felner@inf.ethz.ch

Tomas Felner writes about the features of the TT desktop:

- quite a few new menu entries have been added in the desktop
- most (or all?) menu entries can be invoked with a single keystroke and
those keys are user configurable
- you can assign a full pathname to the function keys and thus invoke your
favourite programs with a single function key keystroke
- you can now have an unsorted index (nice for auto folders)
- you can choose the background color from a menu entry
- there's a menu entry 'Desktop Configuration' where you can set and
configure quite a few things, which I don't all remember
- you can select a number of logical drives and then search for a
file/folder on all those drives. When the search was successfull, a
window with the file/folder opens. And this search is very fast!
- you can read another .INF file and thus change the look of the desktop
- you can switch between several different color tables
- you can have a different border, text and background color for each part
of a window (like close button, expand button, title bar, vertical scrollbar,
left arrow, up arrow, etc ...)
- you can drag any files on the desktop, leave them there, assign different
icons to them, and give them different names (i.e. move the 1stWord icon to
the upper left corner, change the icon to something cute looking, and name
it "Wordprocessor")
- those icons apparently can be edited somehow and you can add you own ones
(I didn't see this but someone told me)
- there's a completely new control accessory with many new options
- there's a new and fast GDOS

Here are additional features that Tomas Felner missed:

- FILE MASK to select the type of file (*.prg, *.tos atat*.* etc)
that you want to see in the windows.

- SELECT ALL function to select everything inside a window.
- Items will stay selected inside a window until the operation is
finished. For example, drag a bunch of files to copy to a floppy disk
and that floopy disk runs out of room in the middle of the operation.
All the copied items will be deselected and unfinished items will stay
selected (Great for doing backup).
Scrolling the window contents up and down will not deselect items either.
You can use cursor keys to scroll the window contents!
- INSTALL DEVICE to install new partitions icon automatically.
- Desktop will look for deskicon.rsc during the boot up time to load in
users designed iocns.
- Choice of passing in file parameter as full path or just file name only
and choice of setting the default directory according to the appliction or
top desktop window when launching an application.
- Support GEM take parameter (GTP) type.
- DELETE ITEM to activate delete file operation. This is useful when
you open full screen window that covers the trash can icon.
- ALTERNATE + ? to open a device where ? is the drive that you are interested.
(This is the most popular fearture).
- CONTROL + ? to replace the top window contents with the new ? drive.
- All the desktop icon's path (the ones that reside on the desktop)
will be updated if that item is being deleted, renamed or moved.
- Option to or not to preserve file date or not when doing file copy operation.
- DESKTOP CONFIGURATION also shows current total free memory size of the
system.
- Key stroke to change resolution.
- Print out current window's contents in text form.
- Maximum seven possible desktop windows.
- User selectable window and desktop backgorund colors and patterns.
- SIZE TO FIT all the items horizontally inside a window.
- Most of the operations in the desktop are loop alike. For example,
if you select four items inside the window and then select the SHOW
INFORMATION menu. The show info dialogue will display the info of all
the selected files one after one. Drag text files to printer icon will
also print out all the files one after one.
- HELP menu.

..... For the rest of them, please read the official owner manual.

Basically, all the features that we have provided are based on
what an ordinary user will need the most and from all the COMPLAINTS and
CRITICISMS (please, no more) that we have received in the past several
years. The TT desktop is nothing fancy, all we wanted to do is to make the
desktop to be truly useful and hopefully people will enjoy using it.

As usual, the above features are subject to change without
notice :-) :-)

1837. Re: Language version (TOS) ?

Newsgroup: comp.sys.atari.st
Date: 1990-09-13 22:07:26 UTC
From: apratt@atari.UUCP
Message-ID: <2296@atari.UUCP>
Source record: 238748

jackin@vehka.uta.fi (Markku M{enp{{) writes:
>I need to know what version (language) my Mega has.

There is a system variable, _sysbase, which points to the "OS Header."
The OS Header contains information about the TOS you are running,
including the country (language, keyboard) you have. That value is
found in the WORD at offset $1c from the address _sysbase points to;
it's called "os_conf" for "OS configuration."

The least-significant bit of this word is 0 for NTSC and 1 for PAL. The
next four bits (at least) encode the country the OS was built for:

VALUE COUNTRY
0 USA
1 Germany
2 France
3 UK
4 Spain
5 Italy
6 Sweden
7 Switzerland, French language ("Swiss/French")
8 Switzerland, German language ("Swiss/German")
9 Turkey
10 Finland
11 Norway
12 Denmark

Other values may mean other things in the future; no tight promises
there. For that matter, this word may lose most of its meaning if, in
future, a single set of ROMs contains the keyboard and language for
many countries. Those issues will be decided when they arise.

>Atari should send them one.

The Byte review for the A3000 was a pathetic three page write-up that talked about little more than the hardware specifications. Hardly anything about the Amiga software features, etc. Hopefully, the TT will get a more thorough review.

I can't see why anyone should worry about what Byte says anyway (except from a marketing viewpoint). The so-called `Journal for Small Systems' has gone done the tubes with regards to any useful technical or intellectual articles. Witness the paucity of information between reams of advertising.

Save the forests! Forget Byte! :-)

FOR SALE

Atari 520st... This system has 2.5 meg of main memory pre
socketed for 4 meg using Tech Specialties memory expansion board.
Midi ports, an RF modulator for connecting the system with a tv.
Serial and parallel ports, and a mouse.

Also included are the following items:

Atari monochrome monitor.
ICD SCSI interface.
Seagate 48 meg Hard Disk with power supply and case.
Two Atari SSDD disk drives.
A Star NX1000 dot matrix printer.

Also included in the package is a lot of software both PD and
commercial including but not limited to the following titles :

Phasar An excellent check book manager.
Cad 3d A 3d drawing and animation package.
Degas Elite a 2d drawing package.
Time Works Desk Top Publisher.
Time Works ST Writer A word processor.
Time Works Data Manager A data base program.
First Word Plus A word processor.
Word Perfect A word processor.
Interlink A very good telecommunications program.
Uniterm A very good PD telecommunications program.
Atari Planetarium A very good astronomical program.
GPLUS a Printing Utility.
Neodesk A very powerful graphical interface to the operating
system.
Turbo ST A utility for speeding up the graphics display.
And numerous other titles both commercial and P.D.

The Atari ST has the ability to run it's own operating system TOS
with GEM and it also will run several other operating systems by
emulation with the purchase of the required software to do so
including MS DOS, CPM, MACINTOSH.

I will not split up the system to sell in parts and the price is
$1000.00. This includes shipping in the continental United States.
For more information call:

I beg to differ! I think having SCSI and VME means there is a great deal of openness. You can buy lots of things on VME cards, even with the relatively limited A24/D16, half-Eurocard, 3U format of the TT's internal VME bus. In Dusseldorf at the Atari fair I saw a company selling a new box for the TT with slots for other form-factors of VME cards. They're still limited to A24/D16 (or A16/D8) but it is not unreasonable to suppose that the TT will have a big brother with full-size VME, more room inside for VME expansion and more rotating media, and a beefier power supply to drive those power-hungry peripherals. Sounds pretty open to me!

(Note: "It is not unreasonable to suppose..." is my way of saying that I'm not giving away secrets, and certainly not making promises, just pointing out the obvious.)

1845. Can anyone out there give a NeoDesk 3.0 summary?

Newsgroup: comp.sys.atari.st
Date: 1990-09-14 02:25:25 UTC
From: n8742883@unicorn.wwu.edu
Message-ID: <1990Sep14.022525.9695@unicorn.wwu.edu>
Source record: 238609

'lo all!

A few friends of mine were wondering what the specs are on NeoDesk 3.0; I own v. 2.05. I've moved around a bit, so Gribnif's specs probably haven't caught up to me. Can anyone out there post a brief description on what 3.0 has to offer?

thanx in advance,

1846. Instant Graphics Wanted!

Newsgroup: comp.sys.atari.st
Date: 1990-09-14 03:12:30 UTC
From: reh2@po.CWRU.Edu
Message-ID: <1990Sep14.031230.7465@usenet.ins.cwru.edu>
Source record: 238616

I'm interested in seeing some new and exciting instant graphics. Are there any on the Atari.archive? If not, how 'bout some people u/l some. As a sysop of an Atari 8 bit/ST BBS I'm currently working on means to make an all out instant graphic BBS. I'd be interested in anybody interested in making custom screens for my BBS? What could they get in return? Oh, I'm sure we can work something out. My BBS which is running on an 8 bit on BBS Express Pro! software (but supports ST probably more than the 8 bit!) can be reached at (216) 381-7859 3oo/12oo/24oo bps 96oo soon!
Thanks,
)_rh_(

1847. Sozobon C

Newsgroup: comp.sys.atari.st
Date: 1990-09-14 04:49:12 UTC
From: ekrimen@csuchico.edu
Message-ID: <1990Sep14.044912.19716@ecst.csuchico.edu>
Source record: 238617

Sozobon is PD right? I'm looking for it for one of my BBS users. I didn't see it on atari.archive. If it's there, please tell me where. If not, could someone please tell me where I can get it or send it to me? The latter would be nice, but any of the others will do as well. Thanks for the help.

BTW, I got some source code from /atari/sources/volume02/sozobon1.2, but it wasn't really what I was looking for. :^) At least I don't think so.

1848. Spectre & Think C ?

Message-ID: <3968@sactoh0.SAC.CA.US>
Source record: 238619

I have not had any problems with my Portfolio over the month and a half I have had it. Once, I killed my addresses, but that was my fault. I take this thing everywhere I go, and I get asked about it alot.

One machine that does interest me alot is the Poquet PC. It is a much better hand held, but then again, you are paying $2000 compared to the mere $400 for the Portfolio. But then again, if they can make the Poquet work, it would be very simplWke &}to have a hand held ST, a Tracy? (You heard it here first!!!)

There are important applications that use the Cartridge Port. We can
just take that Port and use it. Also, I think there might be some
technical problems with this solution as well.. Alan or Derek would
probably know more about what the ins and outs are of this solution
and why we can't use it..

My understanding is that existing compilers don't support passing parameters to GEM applications. Am I mistaken? Is this going to be supported somehow?

>>Atari should send them one.

>The Byte review for the A3000 was a pathetic three page write-up that
>talked about little more than the hardware specifications. Hardly
>anything about the Amiga software features, etc.

In BYTE parlance, at least, that A3000 article was a preview. They claim that they won't do a full review on anything until it's actually shipping and available in its finished form. That's probably not a bad policy; we could have changed all kinds of things between the December/January dates they probably looked at the 3000 and their April publication date (must have been the May or June issue, if it came out in May).

Of course, that's not at all to say they couldn't have done a more complete job. The 15+ page AmigaWorld article was finished at the same time (early copies of both mags were available at the A3000 launch). The other thing is that, while the BYTE staff does the previews, they often count on contributors to do the actual review (at least, that was the case for the A2000). So you often don't see much in the way of a review. Any BYTE has roughly a five month lead time. Given that A3000s first shipped in mid June, I wouldn't expect to see an actual review until the November or December issues, at the earliest. If at all.

>Hopefully, the TT will get a more thorough review.

Maybe it will. If the TT is as out in force as the Atari folk claim, it's really too late for BYTE to do their typical preview on it, unless they just haven't found the space for it yet (hey, wouldn't want to have to displace Yet Another PClone review just to write up a few pages on something with a hope of being a little different).

>I can't see why anyone should worry about what Byte says anyway
>(except from a marketing viewpoint).

BYTE is good exposure, since lots of computer folks read it, and it still hangs, albeit a bit tenuously, to its claim of multiple platform coverage.

>The so-called `Journal for Small Systems' has gone done the tubes with
>regards to any useful technical or intellectual articles.

That's true, but unfortunate. Back in the 70s and 80s, BYTE was kind of a Scientific American of small computer systems. Lotsa good stuff, technical

stuff written so that you didn't have to be an expert to understand it. Now a days it's about as technical on computers as "Car and Driver" is on cars; lots of reviews and editorials, nothing hardcore. There's nothing wrong with that, but in the case of BYTE, there's no adequate replacement available for what BYTE once was. It's a shame when progress means going retrograde.

[tons of crap deleted, along the linues of "my computer can beat up
your computer ... " really mature, useful information, finishing
with the following:]
> It is sick when the new ST `Amiga beater' just doesn't perform as well as
> the Amiga. This also admits that the Amiga is a better computer....

> BYE
> PETRA.

I'm cross-posting this to our colleagues in comp.sys.amiga to ask for
their help in shutting this guy up.

Personal computing has come a long way since the days when users had to
assert their manhood by playing "my computer's better than yours." It's
been several months since anyone in comp.sys.atari.st even played "Ataris
are better than [insert brand name here]", or even "680X0s are better
than 80X86s". Attempts to start such a discussion in this notesgroup are
generally squelched or ignored, as they are totally useless and a waste
of bandwidth -- and meaningless in today's marketplace.

We prefer to use c.s.a.st as a forum for exchanging ideas on how to get
more out of our ST's. Occasionally I even jump into c.s.amiga to see if
there's something that might be useful for my ST (like DungeonMaster
hints :-)

We don't need this kind of garbage. It speaks of a third-grade maturity
and a 1970's mentality. I think we (except for "Petra" -- too cowardly
to use his real name!) are beyond that. It's a shame to see a computer
as nice as the Amiga wasted on a jerk like this.

Please, "Petra", stay off the net until you can post something more
constructive and meaningful. And stay off of c.s.atari.st until you buy
one and have something useful to contribute.

Anybody want to add anything?

Regards
Ray Depew

I have to agree. We are currently looking at some X-terminals for work and these babes are around $5K CDN. I can should be able to get a TT that can do anything these terminals can do and more for about the same price. I personally can hardly wait. I hopefully will be able to use the software from my MEGA at home and have the improvements in speed etc. the the TT should bring.

>>The machine's architecture is too closed to be of
>>any use as a workstation.

>I beg to differ! I think having SCSI and VME means there is a great
>deal of openness.

I would tend to agree, to a point. The typical Desktop workstation, today, isn't very expandable. These are typified by the Sun Sparcstations; the SLC has nothing other than SCSI, the standard Sparcstations have 2 (monochrome) or 1 (color) S-Bus slots open.

True workstations, however, are used in a much different situation that most PCs. You rarely add more than 8-16 megabytes of RAM to a workstation. It probably has a hard disk in the 100-200 meg range, and it's hooked up to a network. Tape backup, modems, additional storage is managed by a server node in the network, so there's little if any need to go beyond what the basic hard disk, memory, and Ethernet in a workstation. You pretty much get all you need in the basic package or over the network. Third party developers aren't crazy about workstations.

On a PC, on the other hand, you're often in need of more configurability, and expansion cards cost considerably less than MultiBus or full-fledged VME. PC users add alternate displays, multiple serial port cards for their BBS, DSP cards for music, massive memory and coprocessors for ray tracing, data boards for lab work, etc. PC cards tend to be cheap when compared with workstation cards, both due to economies of scale and to generally less expensive and complex design requirements on PC buses. Maybe not all at once (Apple claims the AVERAGE Mac II owner uses 1.1 NuBus slots). You can probably substitute a high end PC with a card or two (there days, probably just Ethernet and, for some Workstation needs, a color megapixel display) for a Workstation -- 68030, 68040, 80386, and 80486 machines are CPU-speed comparable with low end computers designed specifically to be workstations.

The other big difference you generally find is software cost. You don't pay $2000 for a Spreadsheet or Wordprocessor for your ST, more likely $100-$200. But it's not licensed for network use.

Okay, the Amiga is a better computer. Happy? It's not like most of us are going to run out and get a new computer. I personally have NO extra money, even if I WANTED to get an Amiga. I personally don't like the Amiga's set-up, nor Commodore itself. I like my ST because I like Atari. I have always like Atari, and I will stand by it because of it.

Also, it's obvious that the ST can't stand up to the Ami3000 (or whatever the latest is). However, once (if ever) Atari puts out a comparable machine, THEN we can DISCUSS it (no flame wars please!).

Finally, I'm sure most Atari owners are well aware of what we can and can not do in relation to the various other systems. I don't think we need to be reminded of Atari management's ineptitude.

Thanks!!

-Steve

1866. My ST crashes

Newsgroup: comp.sys.atari.st
Date: 1990-09-14 16:57:13 UTC
From: domen@crin.fr
Message-ID: <2700@loria.crin.fr>
Source record: 238636

Everytime I have been using my ST for a couple of hours, it crashes. It seems that the bit 6 of odd addresses is turned to 1. just before the crash, black vertical lines appear on the screen. It is then impossible to reboot as long as the computer is warm. I brought it to the local ATARI dealer who was unable to make the phenomenon happen, but it still happens at my home, even if I boot my ST without anything: no hard disk, no floppy, nothing! Does anybody already had a similar problem and could say me what to do? Would it help if I changed the RAMs?

My computer is a 520ST with 1M RAM.

Eric

>give full details? (Sorry, I don't have his address). I cannot imagine
>that this works, but I still would like to pass on the info.

Actually, this is quite possible. All you really have to do is hack the code to Spectre to look for the Mac ROM image on disk instead of a physical ROM plugged in via Dave's box. I actually saw a version of Magic Sac a year or two ago that someone had hacked like this. You'd be surprised at the time and energy these pirates spend to get around paying for software. You'd figure the original hacker would have to spend hours trying to patch the software to accomplish this (maybe longer). It's too bad that these creeps don't get into constructive programming rather than stealing from people like Dave Small.

>Thanks,
>
>David Megginson
>

Cheers,

Chris

>(I can't imagine that the pirates read the net -- do they?)

You ARE joking, right? If you want to see how much commercial software gets FTPed and emailed over the net, just talk to your friendly neighborhood postmaster at your site. I'm sure he/she will have many an interesting tale to tell.

>years. The TT desktop is nothing fancy, all we wanted to do is to make the
>desktop to be truly useful and hopefully people will enjoy using it.

I often heard complaints about Atari not reacting to all the improvements suggested by developpers, especially German developpers. As it looks now, it seems that this wasn't the case at all, at least for the visible desktop improvements. Who knows what they fixed and improved in the GEMDOS, AES and VDI internals (Derek?).

Also, Atari seems to have abandoned its poliy of announcing vapourware.

Now that we know that Atari listens to user complaints and suggestions, we should not complain that they don't seem to do anything. By complaining, we would push them to make early announcements in order to keep us happy. This, however, would result in vapourware. And, as we all know, vapourware is no fun at all.

Atari (Allan, Derek, Ken, John and all the others), keep up this policy!!! Coming up with a new or improved product in a big bang is always better for the image than talking about vapourware for months and years. Others did so (Apple, NeXT, Commodore, Sun, IBM and more) and they were always successfull with it. Why shouldn't you ...

I don't know about that - I compiled the GNU CC sources on a standard
Atari ST with 4Meg and a 700k Ramdisk for the intermediary files
and it took me something like 8 or 9 hours. The time is just a guess,
I started one Friday evening and, with various timeouts and problem
tracking, I finished sometime early Saturday morning. I was pretty
beat for a while after that.

Note this was just the compiler driver, C pre-processor, and C compiler
driver proper. I didn't get to the assembler yet.

You also need something like a 20Meg partition (I used 32Meg)
just to hold all this.

I would use my SUN/3 at work, but, so far, I just get core dumps
when I try to compile the GNU compiler with itself. It takes
quite a while on the Sun/3, too.

From: david@doe.utoronto.ca
Message-ID: <1990Sep15.001007.5493@doe.utoronto.ca>
Source record: 238645

I just finished downloading stbibtex.zoo from our local Sun. I received
it on the Sun from Jon Brodie's BART at atari.archive.umich.edu.
I connected with the Sun using Simon Poole's Uniterm, then quit into
David Beckemeyer's RTX-based MT CShell, where I started up ckermit
in the background, downloading the file. Next, I started up metafont,
also as a background job, generating a new font for the SLM. I edited
a couple of files while these jobs were running, and now I'm back
in Uniterm typing this message.

As a machine, the ST may have its problems. It also has its strengths.
And one of the greatest strengths is the individuals who supply cheap or
free software to make our lives a lot more pleasant.

Just a couple of pleasant thoughts.

David Megginson (in a rare happy mood)

1876. CACHEXXX.PRG bombs with AHDI 3.01

Newsgroup: comp.sys.atari.st
Date: 1990-09-15 00:55:06 UTC
From: schlut@oski.toppoint.de
Message-ID: <5352460@oski.toppoint.de>
Source record: 238646

I run into a problem with AHDI 3.01.

I recently switched from Claus Brod's CBHD Driver to AHDI 3.01, for I
got a 70 MB Hard Disk drive and wanted to use it with only one partition.

As recommend a while ago by Allan Pratt, I tried to install CACHEXXX.PRG.
But even only with a auto folder select program STSELECT.PRG,
the two official fixes TOS14FIX.PRG and POOLFIX3.PRG, the system doesn't
boot. With only the programs listed above in the order STSELECT,
TOS14FIX, POOLFIX3, and CACHE200, it hangs. With any program after
CACHE200, it bombs. CACHE200 prints installation message (as do
the other programs).

All programs are official. I downloaded AHDI 3.01 from the official
Atari Mailbox in Raunheim Germany. I got CACHEXXX together with a
disk based version of TOS 1.4 (8/8/88). The file sizes are

```
----a 3630 11.09.90 22:29:48 c:\auto\stselect.prg
----a 689 11.09.90 22:29:50 c:\auto\tos14fix.prg
----a 1983 11.09.90 22:29:52 c:\auto\poolfix3.prg
----a 820 20.06.89 00:00:00 c:\auto\foldr300.prg
----a 732 28.06.88 17:18:16 c:\auto\cache200.prg
```

Autoboot is installed. shdriver.sys has size 7895. FOLDR300 is not
responsible for crashing. This had been tested.

I have a Mega 2 (4MB) with TOS 1.4 (in ROM, latest german version), a
SCSI Seagate Drive with two partitions, C: 60 MB, D: 10 MB.

Of course C: has a unusual sector size, but A. Pratt claimed, that
this should work with AHDI 3.01.

Please keep reply via E-Mail short. I have to pay 50 cents per
1000 characters for incoming mail.

Greetings,

The program that does this (although it converts *.SPU to
*.SPS--same quality, less storage required). It's called SPSLIDEX. You
can get it on many boards including the official Atari board in CA. I
live in OH, if you're close by and willing, we could arrange for a
'personal' tranfer... It is a great program...

>My computer is a 520ST with 1M RAM.

Sounds a lot like a problem I've been having: the RAM upgrade board sits directly on top of the 68000, thereby preventing adequate ventilation. After a few hours of use I get all sorts of bizzare behavior (including the vertical lines phenonemon). I'm sure it's a heat problem because the 68000 is hot enough to burn my hand when the problems begin. Turning a fan directly on the 68000 "fixes" things. The MMU gets toasty too, which might explain your "bit 6" problem. Try running your ST with the top of the case off; the extra ventilation should alleviate problems like these. If that doesn't help, it's probably something else.

>
> Steve J.

Some may not support parameters. Others do. Sozobon (dLibs with GEMFAST
or GEMQ) allows parameters -- there is no separate GEM startup module.
There are existing GEM application that take args; I think First Word
is one of them.

I would like to see a Desktop that allowed me to drag a data file to a
program icon. That would let me install my own print output formatter
or communications program on the Desktop as if it were a device. I believe
the IXI desktop for Unix works that way -- perhaps others do, too.

As an aside -- I'd like to thank Derek for posting the info on the TT
Desktop. With the TT finally hitting the dealers, and the recent drops
in chip costs, things are really brightening up. I stopped by the local
Atari dealer the other day and was pleased to see 4-megabyte STs selling
for $895 or so (sans monitor). Add Pagestream (running off a RAMdisk)
and a Deskjet and you have a very nice little desktop publisher.

1882. PC-Ditto II - at last!

Newsgroup: comp.sys.atari.st
Date: 1990-09-15 19:46:20 UTC
From: silvert@cs.dal.ca
Message-ID: <1990Sep15.194620.16114@cs.dal.ca>
Source record: 238652

To my great astonishment PC-Ditto II finally showed up a couple of days ago. I had ordered the original upgrade -- how many years ago was that? and early in 1989 I bought a DOS laptop since it was clear that AG wasn't going to ship. Letters requesting a refund were ignored. Finally it showed up. The board looks used -- the backing is already stuck on and the coprocessor jumper is in place. It took me days to get it working, since those bloody pins are hard to squeeze, but it seems to run OK. To my great surprise all kinds of programs, like WP, WS, QB, and 123 run on my ancient 520, even though PCD reports only 384 K free.

Alas, by the time I got the pins tight enough to make contact, I seem to have introduced a jiggle to the screen (both in ST mode and in DOS). I don't know anything about the innards -- this is the first time I have opened up the machine -- and if anyone has an idea on how to get rid of the jiggle, it would be appreciated. Judging by recent postings, further attempts to contact AG would be a waste of time.

>You mean the amiga still need to use a kickstart and workbench disk
>to get you going? And you still need to use that cli???? And this
>is supposed to be a superior computer. hmm. that was the whole reason

NO! Kickstart disk was only designed for the first machine - A1000, since then, 256k ROM has replaced it for A500 and A2000. On A3000, it has the new 2.0 ROM(s), 512k. It also comes with the older 1.3 ROM images on HD for compatability reason(2.0 is not 100% stable, yet.)

And as I pointed out before, CLI is NOT necessary for running ordinary programs, such as WP, DTP, etc. I use it to program, in which case, I find CLI much more convinient than GUI interface, and I'm sure this is true on any machine if the machine offers both options.(Well, for most people).

That would be no fun, eh? Oh well. But what good has speculation done in the past, particularly in *this* newsgroup? }-)

>I don't get it. The machine's architecture is too closed to be of
>any use as a workstation. The price is too high for a home computer.

Too closed? I don't understand. Sun 3/50s and 3/60s are pretty closed systems, (particularly 3/50s!) but nobody bats an eye when you point to them and say "workstation!". The 3/50 is just a fixed board in a sealed box, no expansion options whatsoever. (No, you say, you can expand the memory in a 3/50 with 3rd party expansions! How is this any different than the ST?)

Price is certainly an issue for personal systems, but I've seen a lot of pricey home computers these days. I think the world has seen enough ZX80s and VIC20s and PCJrs by now to realize that computers for the home should not be stripped down to the level of toys. If you want it to be useful, and have a serious purpose in mind, you will get a "serious" machine.

>There is no unix available to entice educational institutions to

>I wouldn't mind having one myself. I'm just trying to ask some
>real world questions.

They've done a smart thing, they've contracted another company to port Unix to their platform. (Unisoft.) I don't think lack of unix or networking will be a problem for long, especially given Unisoft's rep.

Who wants 386s? Who wants Mac IIfx's? People like speed. For the most part they don't care about the other features of the architecture, like the cache operation, bus cycle times, memory management, pipelining, etc., but they can see the speed difference. If Intel made a 40MHz 8086, they could probably sell millions. Nobody cares about the majority of the improvements of a 386 over an 8086, they just like speed. (And of

course, the large fraction of those who *do* care care for the wrong reasons. So it goes...)

Good points. I wonder why none of these big guys have trouble with the FCC and pre-announcing new systems. Perhaps because they don't target the home market, and it's easier to get class A certification than B or C. But Atari hasn't done any serious advertising in a long time, why would you expect that to change now? Especially with their current anti-vaporware policy?

Your margin of error is pretty big: The Sparcstation SLC will cost around 12000 DM (in words: twelve thousand DM). And its a diskless, fanless SPARC workstation - not much good for the home user without a server, eh.

I'll look up the prices for a MacIIic, the average 386 PC (33 MHz, 4MBRam, colour VGA and >=48MB hd) and keep you posted about their price. Maybe I can even find out what an Amiga 3000 costs.

On the whole I think we'll soon see the TT in the mentioned configuration for less that 7000 DM. And that's a pretty good offer. Power without the price is one thing. You always have to show a profit, though, as you've said yourself often enough.

So long.

I just purchased Empire yesterday (made by Intersel). I am having a slight problem with the security access. The program says to look up a word in the SCF-TM-2775 SA manual and I have the SCF-TM-2775 ST manual. The only word that I have found that works is on the first page of the manual. Are these two manuals different, or I am just not entering the words correctly?

Thanks,

If you do, or if you start doing it more, it will definitely be a welcome change. I have not even bothered to glance at a Byte in a large number of months, since I really was not interested in reviews that raved about yet another fractional increase in clock speed hailed as a significant improvement.

>We recognized some months ago that people were starting to see us as strictly a
>PC book. So, we're changing. Lots of changes are already in place, but 1991

>September (if you can lift it) and October issues for a few tastes of things to
>come.

I hope so. I have nearly every issue, right up to about 1987, and from then on, they get more and more sparse. It will continue on if I see a swing away from slavish devotion to Intel, IBM, and the clone makers, but that hole in the collection will remain. I won't have the sort of garbage that's been in the magazine recently cluttering my home. I'll look for the issues you mention, with a feeling of hope that you are saying sooth.

>I assume you call our multi-platform coverage "tenuous" because it hasn't
>included much Amiga. Well, that's about to change. No details there, either.
>Wait and see.

I don't. I call it tenuous because for a VERY long time, nothing seemed to get reviewed unless it was an IBM compatible, or unless it was capable of emulating it. I watched with horror as article after article completely ignored large segments of the industry, ignored superior hardware, ignored superior software, while fawning over MsDos, OS/2, Intel, and so on.

Somebody once said that if Cray were to come out with a shirt-pocket, 100 MIPS machine with 20 megs of memory and 1 gig of disk, and sold it for $300, the first thing the industry would ask is "Is it IBM compatible?". This is the feeling I got whenever I looked at a Byte in the past few years.

>Before you complain about how BYTE has lost its teeth, go out and buy the
>September or October issue. Read it, thoroughly, and if you still don't like

I sincerely hope you are right in what you say about new directions. Byte has too much influence to be in a position of promoting nothing but the lowest common denominator to those who know no better.

>
> >The Byte review for the A3000 was a pathetic three page write-up that
> >talked about little more than the hardware specifications. Hardly
> >anything about the Amiga software features, etc.

Not much was said about 2.0 because our VERY early pre-release version wouldn't run for more than a few minutes, and we had no 2.0-compatible applications, except for AmigaVision. Bob (the author) talked about everything he worked with. It's appropriate not to discuss those things you can't see and touch.

> In BYTE parlance, at least, that A3000 article was a preview.

Actually, BYTE parlance refers to it as a "First Impression." Same thing.

> They claim that
> they won't do a full review on anything until it's actually shipping and
> available in its finished form. That's probably not a bad policy; we could
> have changed all kinds of things...

Right on--we've run early full reviews of supposedly "golden beta" hardware and found that the vendor changed EVERYTHING when it went to market. That's why there is a clear distinction in the magazine between reviews and First Impressions. We aren't trying to fool anyone. A FI is just our way of introducing a new product to the public.

We also avoid injecting much opinion into FIs because it pisses the vendors off. I'm sure you would have enjoyed an article that included "...the system crashed every few minutes, and virtually all the Amiga software we tested wouldn't run on the 3000." You'd have been livid, and rightly so, because it isn't fair to fling knives at something that's still under development.

> Of course, that's not at all to say they couldn't have done a more complete
> job. The 15+ page AmigaWorld article was finished at the same time (early
> copies of both mags were available at the A3000 launch).

We gave the 3000 the same amount of coverage as any other First Impression; actually, it got a little more. Our FI of the Apollo 2500, which was arguably just as important (maybe moreso--it kicked off the low-end UNIX workstation market), got two pages.

AmigaWorld lives or dies by virtue of the Amiga's success. Of course they gave it 15 pages. If we were a single-platform mag, we'd make a big fuss over the latest box, too. Nothing wrong or dishonest about that; we all need to make a living.

> ...while the BYTE staff does the previews, they often count on contributors
> to do the actual review (at least, that was the case for the A2000). So you
> often don't see much in the way of a review.

I wouldn't say that's true. When we go outside the magazine to do a review, it's because we (the editors) feel that an outsider has more expertise. We try to find experts to do our reviews. We don't always manage, but there has been some excellent work in the past few months. We have also been doing a hell of a lot more testing and writing in-house. Virtually all of our UNIX workstation pieces are handled that way. Future Amiga-related articles probably will be, too.

> Any BYTE has roughly a five month
> lead time. Given that A3000s first shipped in mid June, I wouldn't expect to
> see an actual review until the November or December issues, at the earliest.
> If at all.

Our lead time is four months, and we've got changes in place to trim it to three. Vendors aren't the only ones aggravated by that.

I don't think we've scheduled a 3000 review. We received our loaner about a month ago, and we're starting to get some software and accessories together for it. The rule is, if you can't say much more than what was said in the First Impression, don't bother. Right now, that's the case; there isn't much we can add until more 3000 (and 2.0)-specific software and add-ons start to appear.

Of course, not being in the "Amiga department" per se, I'm only speculating.

> >Hopefully, the TT will get a more thorough review.
>
> Maybe it will. If the TT is as out in force as the Atari folk claim, it's
> really too late for BYTE to do their typical preview on it, unless they just
> haven't found the space for it yet (hey, wouldn't want to have to displace
> Yet Another PClone review just to write up a few pages on something with a
> hope of being a little different).

Atari has a reputation of being uncooperative with non-Atari-specific mags. We have never, to my knowledge, gotten a review unit of ANY recent Atari machine. We ask, brother do we ask, but we never get a response.

As for displacing a PC clone review, balderdash! Open any recent issue of BYTE, and you'll see reviews of software development tools, UNIX workstations, Mac stuff, graphics hardware...PCs get a lot of ink because they are rolled out more quickly than any other type of computer, but we go out of our way to make sure that other platforms get covered. If anything, we kill PC clone reviews in favor of something more interesting.

We recognized some months ago that people were starting to see us as strictly a PC book. So, we're changing. Lots of changes are already in place, but 1991 will bring an almost entirely new BYTE. I won't give away any secrets, but we're working to bring back a lot of the nuts-and-bolts, technical leadership that made BYTE so popular way back when. It's already happening. Check out the September (if you can lift it) and October issues for a few tastes of things to come.

> >I can't see why anyone should worry about what Byte says anyway
> >(except from a marketing viewpoint).

Eventually, EVERYTHING boils down to dollars and cents. The reason 500,000 people read our magazine, and we sell millions in ads every month, is that we ARE taken seriously. I get calls all the time from readers asking for advice about UNIX systems and software, and I know the other editors are all in the same boat. I'm busy enough that I figure somebody must be paying attention.

>
> BYTE is good exposure, since lots of computer folks read it, and it still
> hangs, albeit a bit tenuously, to its claim of multiple platform coverage.

I assume you call our multi-platform coverage "tenuous" because it hasn't included much Amiga. Well, that's about to change. No details there, either. Wait and see.

> >The so-called `Journal for Small Systems' has gone done the tubes with
> >regards to any useful technical or intellectual articles.
>
> That's true, but unfortunate. Back in the 70s and 80s, BYTE was kind of a
> Scientific American of small computer systems. Lotsa good stuff, technical
> stuff written so that you didn't have to be an expert to understand it. Now
> a days it's about as technical on computers as "Car and Driver" is on cars;
> lots of reviews and editorials, nothing hardcore. There's nothing wrong with
> that, but in the case of BYTE, there's no adequate replacement available for
> what BYTE once was. It's a shame when progress means going retrograde.

I hate to harp, because I know virtually everyone reading this is saying, "yeah, right." But McGraw-Hill, the company that publishes BYTE, likes to make money. A lot. And any time they start to see our market share decline, they demand that we take steps. We are taking steps, radical ones. Everything from playing with the cover (little things) to purposely stepping up our UNIX coverage (big things). We're constantly doing research, polling our readership, and trying to make the magazine something more people want to read. You've pointed out a few of our flaws, and we are aware of them (and many others). You can't imagine how hard we're working to improve.

Before you complain about how BYTE has lost its teeth, go out and buy the September or October issue. Read it, thoroughly, and if you still don't like what you see, write and tell us why. Every letter we get is read and discussed, and readers' opinions DO have an impact on how the magazine works. That's not self-serving bullshit, it's the truth. When you get to be BYTE's size, you thrive or perish on the basis of reader satisfaction. One piece of

advice: Don't send a vague letter ("Howcome you don't have more Amiga coverage? Huh?"). Tell us what you want, why you want it, and why you think there are others out there who agree with you. I've seen changes made based on a single, convincing letter.

There is a new BYTE coming, and I think that the readers we've lost over the past few years will start coming back. Oddly, when I started working for BYTE, I didn't read it. I, too, was a fan of the "old BYTE," back in the days of Ciarcia and the like. Now, I'm up to reading about 1/3rd to 1/2 of the editorial material, and it's really starting to grow on me again. Comments from people I run into at trade shows seem to support that trend.

Hell, they'd pay me whether I read it or not. Probably 50% of my job is reading, and I don't like to waste that time. Only recently have I found that BYTE is hitting the targets I, as a reader, want them to hit. My targets haven't changed--BYTE has. And will.

Sigh, since I can't afford the SLM804 Laser, I've decided on the new H-P DeskJet 500. Better quality, quieter, and only about $200 more than the Panasonic 1124.

But a few questions though, before I get it, I currently use Write with GDOS, and for the users of DeskJet and DeskJet Pluses, are there any interface considerations? Printer drivers? Emulation? Does the DJ500 have a Epson LQ emulation? Or is there a DJ driver for Write? (Yeah, I know, I should get Word Flair...)

And I remember a problem with some Ataris and DeskJet and the parallel port?

Some months ago, a German Atari magazine had a map printer on it's pd disk.
It lets you print maps of a saved game of both, DM and CSB. You can even
edit the status of doors and traps.

Since I don't know the Copyright, I won't post it. Maybe the author is
listening, or somebody who knows him?

Source record: 238674

Can someone at ATARI or elsewhere tell me _where_ the TT's fast RAM
is located in address space? How do you detect legally if fast RAM
is present? Currently, I intend to look for a _FRB cookie in the
cookie list; if it's there, the machine has fast RAM. But where is
it? Is the TT's memory mapped by the MMU so that it appears
contiguous? Don't tell me a legal program need not know about
fast RAM - I need this info for my hard disk driver which has to
decide if some transfer is to be made into fast or slow RAM. Tnx
for any help.

1906. Wanna buy a Spectre GCR from U.S.A.

Newsgroup: comp.sys.atari.st
Date: 1990-09-17 09:40:43 UTC
From: jackin@vehka.uta.fi
Message-ID: <1576@kielo.uta.fi>
Source record: 238676

I would like very much to buy a Spectre GCR with ROMs.

Now I am asking you where to look. I don't necessarily want
the lowest price, fast & reliable service is more important.

requirements :

1. somewhere in the U.S.A.
2. has a FAX machine
3. accepts foreign orders (cash)
4. can offer both GCR & ROMs

Now people, tell me about your favourite dealer/mail order house.
I will summarize if interest arises.

Thanks,

Markku.

1907. CUMANA 2x1MB floppy station for sale

Newsgroup: comp.sys.atari.st
Date: 1990-09-17 10:56:59 UTC
From: rughoeft@fokus.berlin.gmd.dbp.de
Message-ID: <hug.653569019@uranus>
Source record: 238677

Hello Folks !

This item is a station with two 3,5" NEC1037 drives, integrated power supply
and Shugart-to-ST cable adapter.
I have run the drives about three years at an 520STM without any problems, and
they are still whispering when used.
Since i have bought a MEGA 2 and sold the old 520ST without the drives, i have
to `get rid of them` :-).
Due to the Shugart-to-ST adapter, the drives are only connectable to a 260
(are there still any out there ?), a 520 or a 1040 (possible but senseless
for the last).

The drives are formatting up to 86 (!) tracks, 11 sectors completely reliable
(that's 959488 Bytes free on disk).
The drives were made in April 1986, bought and used since spring 1987.

I'm asking 500,- DM plus mailing expenses.
If anyone interested from other european countries you may pay me by ec-cheque.

Offers by email to rughoeft@fokus.berlin.gmd.dbp.de, or if
our X.400 does not like you (or the other way around), try
hugo@gmdtub.uucp (BANG me at ...[mcsun]!unido!gmdtub!hugo)

Ciao, HuGo

TIPS AND HINTS from other users

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, and STacy.
There are also emulators for the Apple Macintosh and IBM XT available.
Finally, there is the Lynx (a game machine) and the Atari TT and ATW.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st
comp.sys.atari.st.tech
comp.sources.atari.st

What sort of articles would interest people reading comp.sys.atari.st?
======================================================================

The most interesting articles are technical articles, impressions of
software/hardware, information on Atari user-groups and shows, or helpful
hints on how to make better use of the machine and its software.

The least interesting articles are in the form of 'my computer is better
than...', especially when cross-posted outside of comp.sys.atari.st. If
```

you don't know how to eliminate other newsgroups from a reply to an article which is cross-posted, ask your systems administrator.

'FOR-SALE' articles should be posted to misc.forsale, and ONLY local distribution of comp.sys.atari.st. Those outside the United States have little desire to read about that neat bit of [hard/soft]ware you're selling when you live in the U.S.A. If you don't know how to restrict distribution of a posting, ask your systems administrator.

Many articles are in the form of "How do I...?" or "Where do I...?" In this article, I will try to answer some of the most-often asked questions.

Where can I get Public Domain/Shareware software?
==========

There is an FTP source and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

For anonymous FTP: atari.archive.umich.edu [141.211.164.8]

User anonymous
<enter password>
cd /atari

The atari.archive server is now available via e-mail as well. To find out more about bart (the mail server), send a message to atari@atari.archive.umich.edu with a body of "help". You will get a message back with the help file.

For anonymous FTP: dsrgsun.ces.cwru.edu [129.22.16.2]

User anonymous
<enter password>
cd pub/atari

The dsrgsun server gave me the following message when accessed 15 August:

pub/atari contains atariST Tos files
pub/minix contains atariST Minix files
pub/Composers is the Prolog Composers archive
pub/plink is the Prolog "lint" checker
pub/promix is the Prolog MetaInterpreter
NEW: (updated Apr 9, 90) in pub/atari:
gcc V 1.37.1 for Tos
PatchLevel 56 of the gcc-tos library
microRtx bindings for gcc
updates for all utilities in util.zoo
emacs V18.55 for Tos. New version
gprof and profiling support for gcc tos
V1 of GnuSmalltalk for TOS - 4M machine req
NEW: pub/atari/UPDATES contains diffs for updating the tos library.

Most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

For the panarthea mail server, see Steven Grimm's monthly posting.
Panarthea holds all of the comp.sources.atari.st/comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so.

How do I deal with Archived files (.ZOO, .ARC, .LZH)?

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are
binary files which may contain one or more other files in a compressed format.
Archive files usually take up less disk space, and for this reason have
become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive
program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

These programs are all available via FTP from the atari.archive server, in the
/atari/archivers directory. Recommended files are:

arc.ttp - needed to extract the other archivers, once.
arc_602.arc - latest version of ARC, with the most fancy features
and quite a lot of documentation
lharc.arc
zoo_bin.arc

There are also several GEM programs which act as 'shells' for the archive
programs. The most popular are Shareware offerings, also available on
atari.archive server in the /atari/archivers directory. They are:

arcgsh21.arc - European in origin
arcsh197.arc - US in origin

The GEM shells are recommended for inexperienced users (and appear to be quite
handy for the experienced user as well!) They require a copy of the archive
program -- in other words you need BOTH the GEM shell *AND* the archive
program in order to use the GEM shell.

NOTE: arcgsh has been updated to version 3.1. It is currently unavailable
on the atari.archive server, but should be available on the panarthea mail
server.

Documentation on the use of the archive programs should accompany the archive
files mentioned above. To use ARC.TTP in order to extract these files, use the
command line:

xh xxxx.ARC *.*

where 'xxxx' is replaced by 'arc_602', 'zoo_bin', etc. For example

xh arc_602.arc *.*

will place all files within the arc_602.arc into the current directory. It assumes you've clicked on the ARC.TTP program from the Desktop and have the parameter dialogue box on your screen.

In many cases, simply typing a '?h' will provide an extensive list of available options.

Source and binary code for archive programs have also been posted to comp.sources.atari.st and comp.binaries.atari.st. They are available via e-mail through the panarthea archive server. See Steven Grimm's posting for more information on how to obtain files from panarthea.

What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

Below is a letter, originally written by Darryl May,
that John Townsend of Atari posted on GEnie in January to provide some answers. This letter also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170).

Dear ATARI customer,

The following is an official list of the errors that can appear while you are operating your ST computer. This first list gives you the GEM error messages:

Error description GEM Error code
==========

What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

What is GDOS, and where can I get it?

GDOS stands for Graphic Device Output System (at least that's what my copy of STart, volume 1 number 1 said...)

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and more)" by Douglas N. Wheeler from the atari.archive server. The file is /atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files or font files (at least those supplied by Atari). You can get these files with many commercial programs, such as Degas Elite, WordUp!, etc. You might also want to check your local user group to see if they received a copy of the WordFlair demo program (also available on GEnie). The demo program appears to have the GDOS system and font files.

Is TeX/LaTeX available on the Atari ST?

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the atari.archive server under /atari/tex, or the dsrgsun server under pub/atari/StTeX. Fonts and device drivers (including one for the Epson 9-pin printers) are available on the atari.archive server.

Public Domain/Shareware languages...

Check the atari.archive server under /atari/languages. Currently included:

abc recently posted to comp.binaries.atari.st
apl demo version
forth Don't know which one. I recommend Bradley FORTH
icon
modula-2 From Germany
Sozobon C Most excellant
Elan
xlisp
xprolog
xscheme

Version 1 of GNUSmalltalk is also available on dsrgsun.ces.cwru.edu. It requires a minimum of 4 megabytes of memory. It is also in the pub/atari directory.

Is GNU C available on the Atari ST?

You can also get the GNU C program, which runs on 1 megabyte Atari ST systems. For more than minor programming, you may need to upgrade to 2 or more megabytes, as the GNU programs generally assume you've got plenty memory.

GNU C for TOS is available via anonymous FTP on dsrgsun.ces.cwru.edu
[129.22.16.2] in the pub/atari directory. Be sure to check the README file
before going further.

Where can I get copies of ZNET?
==========

ZNET on-line magazine is available on CompuServe and GEnie. You can also get
copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg
Lindahl provides an excellent service to the networking community by sending
these out.

ZNET and some information from the Current Notes user magazine are also
available from the atari.archive server under /atari/magazines.

ST Pen Pals list
==========

Simon Chappell is compiling a list of people interested in exchanging
paper-based mail "of interested parties who could then
keep in touch and prevent themselves losing touch with the ST community
at large (this would be especially easy if someone who still had net
access could summarise current topics or forward news and advice!)"

He is accepting entries in this format:

eg Simon Chappell.
s61304@uk.ac.psw.pa (NOTE: NO LONGER VALID ADDRESS...)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

Contact Simon at his paper mail address if you are interested.

TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used
with the ST; the custom cable involves no tricks, or commercial ones are
available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by
putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of
the boot sector (sector 1 of track 0, I believe). This can be done with
either an ST or PC absolute sector editor.

When using disks formatted on a PC in an ST, make sure to insert and access
a disk with a different serial number in between disk changes.

==========

I would like to thank those who sent messages with suggestions and comments. I would appreciate feedback, comments, suggestions for more TIPS AND HINTS, etc. E-mail can reach me at the following:

1909. Atari sound

Newsgroup: comp.sys.atari.st
Date: 1990-09-17 11:34:56 UTC
From: CATHRYN@bdt.UUCP
Message-ID: <5061@bdt.UUCP>
Source record: 238679

I keep hearing the STE has enhanced sound, but I still don't know exactly what has changed. Did atari put in an AY 8930 instead of an 8910? Are there more than 3 voices now? Or are the existing 3 voices divided among the left and right channels?
Is digitized dma type sound the only change?

1910. cc.arc on atari_archive (Help ?)

Newsgroup: comp.sys.atari.st
Date: 1990-09-17 14:42:05 UTC
From: paulm@ccicpg.UUCP
Message-ID: <87250@ccicpg.UUCP>
Source record: 238680

I've tried twice to get the cc.arc file from atari.archive.umich.edu!atari
and the files I get when put together and unarced are bad. I get a
bad header error when extracing or anything else. The file I'm talking
about is the: Sources/volume01/cc/cc.arc.

I've tried the sendb on cc.arc and also the part01 and 3 other files.
No luck.

I would really like to get ahold of the cc sources so I can set it up
for my environment: Alcyon C on H:/alcyon/ with headers and libs elsewhere.

If anybond can send me the source or show me the error of my ways :^) I'd
apreciate it.

Thanx in Advance, Paul Moreau.

From: rlee@weaver.ads.com
Message-ID: <RLEE.90Sep17132035@weaver.ads.com>
Source record: 238684

In article <V3uiP2w163w@bluemoon.UUCP> archbold (Archie Jaszcz) writes:

|> Does anyone know of either a way to convert these to
|> SPC (sprectum compresed) files or where I may find a viewer for the SPUs?
^^^
|> John Tallarico

| The program that does this (although it converts *.SPU to
|*.SPS--same quality, less storage required). It's called SPSLIDEX. You
^^^
|can get it on many boards including the official Atari board in CA. I
|live in OH, if you're close by and willing, we could arrange for a
|'personal' tranfer... It is a great program...

Um, Archie... John was asking about SPC, not SPS. Every program I have
seen for displaying Spectrum pictures displays both SPU and SPC but not
SPS; in recent e-mail he told me had found one. Meanwhile, _I_ have an
SPS file I can't do anything with. Does SPSLIDEX in fact display or
convert _SPS_ files?

1916. Which System/Finder combo works w/Spectre2.65&TOS1.4

Newsgroup: comp.sys.atari.st
Date: 1990-09-17 18:20:46 UTC
From: jfbruno@rodan.acs.syr.edu
Message-ID: <1990Sep17.182046.13394@rodan.acs.syr.edu>
Source record: 238686

I've been using Spectre 2.65 with the Spectre 128 cartridge and Mac System 6.0/Finder ??? (something like 6.0). When I upgraded to TOS 1.4, Spectre bombs before the Finder comes up, so now I have to use an older Sys/Finder combo. Does anyone out there use Spectre with TOS 1.4? What's the highest System/Finder combo you have gotten to work? I'd like to use something over 6.0, since I need the newer Control Panel with the cdevs in the scrolling window on the left. I haven't checked for viruses yet, but I don't think a virus is very likely.

Thanks for any help
---jb

1917. Spectre/SCSI question

Newsgroup: comp.sys.atari.st
Date: 1990-09-17 18:28:01 UTC
From: jfbruno@rodan.acs.syr.edu
Message-ID: <1990Sep17.182801.17937@rodan.acs.syr.edu>
Source record: 238687

I know that it's possible to use a SCSI drive with a host adapter on an ST with Spectre, but is it possible to move the drive over to a Mac and directly use the partition created by Spectre?

I borrowed a friend's SyQuest drive and formatted and partitioned a cartridge with my ICD utilities. I made a small TOS partition, and one for the Mac. I then formatted the "Mac" partition with the Spectre software. Things were fine on the ST, I could see the TOS partition, and I could see the other partition when running Spectre. I then gave the drive and cartridge back to my friend and asked him to try and read it on the Mac in his office. He couldn't see the partition, the disk was not recognised. Is there a way to swap cartridges this way? Is there some software for the Mac (reasonably priced, that is) that will handle the partitions (I had the Mac partition as the last one, since TOS stops looking at partitions after it finds a non-TOS one.) Does Spectre use a proprietary format for its partition?

Thanks for help
---jb

Works fine on my Supra drive too. ResEdit 1.2 was supplied with our
Think C package and it works fine, except Spectre crashes when you try
to Play a sound resource. Takes a _lot_ of space (Dratted projects!).

The Debugger does not work at all. There are strong rumours that
Dave Small is working on this (in between Appletalk and 68030 boards)
- most debuggers need very low-level access to the machine to work and
this gives current Spectres grief.

>
> Stuff deleted ...

Yes, the TT desktop has that feature! Dragging any data file icon
on to a program icon will simply launch the program with that data file's
name as the input parameter.

Every compiler I have seen for ST computers (lots of C, Modula, Pascal) supports parameter passing to any program: they do not care about the application type. For example even the first version of 1st Word can handle Filenames as parameters ('Install Application' 'DOC'). This feature works also with Calamus (CDK), Turbo C (C-Files). All you need to do with current desktop versions ist to use 'Install Application' (or something similar - i've never seen an english TOS version) in the EXTRAS Menu. However, you will probably have to play around with the location of RSC files (and CFG's and HLP's and ...).

This is one example how bad documentation can prohibit the use of a really nice feature. It took more than four years, sloppy speaking, to spread the information about how shel_find() works, and to release a TOS version (1.4) that implements it in an intelligent manner. A lot of programs for the ST in use today don't use this routine. As the result you will probably get problems using the 'Install Application' Feature. Even using TOS 1.4 1st Word Plus versions started via double click on a DOC file icon will probably fail to load the default printer configuration PRINTER.CFG. (disclaimer: I've only seen 2.x versions).

System 6.04 is the highest I know about but 6.03 or 6.02 will work fine.
Just don't use 6.0 or 6.01 since those are very buggy. One thing to keep
in mind is that with 6.04, programs think they are running on a Mac
512ke and not a Plus even if you change the flag. Being a Plus works
fine under 6.03 and down.

> I haven't checked for viruses yet,
> but I don't think a virus is very likely.

Reinstall the system. If I remember correctly, people on the net reported
initial problems with hds and tos 1.4. It never happened to me since I
reformatted as soon as I got tos 1.4 and I really enjoy the speed
improvement!!!

BTW, I use 6.04 since none of the programs I use care about being in a
512ke.

From past experience (hi Gerry!) the problem might be that the Mac is looking at what would be the ST partition table and getting mighty confused. I guess that is where some improtant mac info is kept.

I know you can install Mac hard drives into your system and have Spectre recognize them so that's an idea. I guess once Dave implements CHANGING of Syquest drives then you'd be able to take a mac formatted cart and possibly insert into Spectre (changing doesn't work, right?).

Enough rambling,
Marshall

From: eugene@cs.athabascau.ca
Message-ID: <757@vax.cs.athabascau.ca>
Source record: 238695

I just had a letter returned which I had sent to Avant-Guarde Systems regarding my PCDITTO-II. It was stamped "Moved - left no address - Unable to forward"!

This certainly looks like Avant-Guarde has gone belly-up and is now OUT OF BUSINESS. This confirms the recent message on the network regarding Avant-Guarde's lack of phones. Does anyone know any more details about this? This does not look good for us PCDITTO users! And I just got mine working after having to hack apart the insides of my 1040 to install it.

What I was writing them about is.... I received a very early version of PCDITTO II and the software disk they sent didn't have all of the programs they mentioned in the installation manual. Also, they didn't include a user's manual. Does anybody have the software and user's manual that they would be willing to copy and send? I'll pay for any copying and mailing costs with gratitude!

Gemini (shareware alternative desktop widely available) supports dragging
file(s) to desktop icons to pass as parameters - I do this all the time
with MicroEmacs.

Neodesk 3 claims this feature, I believe. Will someone please holler here
when they actually get a Neodesk 3?

I've been using a Packard-Bell 2400 modem for some time. For the price
($120 on sale at "Service Merchandise") it seems to work well. I get some
garbage at times, but don't know if it's the modem's fault or what.
It has all the features and commands and leds.
I'd call it a "good" modem, and I'm curious as to what makes a modem "great",
and whether there is that much of a performance difference between modems.

1932. MIDI beginner, STart disk, Sampsyn

Newsgroup: comp.sys.atari.st
Date: 1990-09-18 00:53:52 UTC
From: reyy@vax5.cit.cornell.edu
Message-ID: <1990Sep17.205352.44@vax5.cit.cornell.edu>
Source record: 238551

I have two questions that are somewhat closely related.

First of all, I'm very interested in learning about MIDI. Some of my friends are musicians (although I'm not) with MIDI keyboards, etc., and I have an ST... a match made in heaven! I'm looking for a sequencer that's cheap, but can do all the basics, like editting and that stuff (you're the experts, you tell me!) Is there anything public domain?

This leads me to my next question, because there is a program in the JULY 90 issue of STart that looks to be about what I'm looking for. My question is, is this program (or any other in STart) considered to be public domain? (i.e., can I get a copy from one of you, or do I need to order the disk from STart?) (BTW, the program is called SUPER CONDUCTOR)

Okay, I lied, I have a third question, also relating to the JULY 90 issue of STart... Has anyone tried making Sampsyn? About how much did it cost, and about hours many hours did it take to build?

Please send any information you have on any of these questions to my email address. Thanks in advance for any/all help!!

David Rowell
Internet: REYY@Vax5.cit.cornell.edu

The update package of PC-Ditto II never had the user's manual. The disk
also didn't have the diagnostics programs. The user's manual is unnecessary
as they didn't have anything new (from the original PC-Ditto) to tell anybody.
This does not bode well that they've moved. I'll see if there's any talk on
Compuserve on this subject.

From: ddyer@hubcap.clemson.edu
Message-ID: <10502@hubcap.clemson.edu>
Source record: 238554

I own an IBM AT clone and am wanting to get a "dream system" after I sell the IBM. Well, I've narrowed it down to these two machines (or some other high end Atar).

I have learned a lot from the "flames" that went on. Those seem to be the most informative and exciting postings (debate type). I don't wish to see "who's better" postings or email on this, but advice and honest insight on your machine (to me, this would be a huge purchase, and I need to take into consideration all advice).

I am wanting a machine that is both fun (ie. entertainment) - this means sound and graphics without addons, animation & graphics (ie. 3D modeling, ray trace for "hobbie"), application software (ie. word processing), reliability and price/performance. These two machines match most of what I want.

Please, anything you have to say would be appreciated. I know much more on the Amiga right now than the Atari.

Doug Dyer

Well, you have 4 choices. All of them involve the Syquest SQ-555 44mb removable platter mech. Three companies (that I know of) make such a beast for the ST: Toad Computers, Carter Enterprises, and Atari. The fourth choice is to roll your own. I have a buddie that just bought a magnum Toadfile (this is the toadfile drive w/three cartridges), and he loves it. I would recommend it over the Atari unit because of both price and the ICD controller in the Toad. I have not heard much about the Carter entry, other than it is contained in a small shoebox-style case. The Toadfile has room and cables for one more device (but maybe only 3.5", I cannot remember). Since it is an embedded SCSI device, whipping one up yourself should be cake. Just get a baby AT case with power supply, and ICD host adaptor, and a Syquest. You can get a Computer Shopper and hunt down a Syquest mech (I was quoted a price of $519 about a month ago). Bolt all the stuff together, and voila. One last footnote: I have heard that Syquest is about to release a new mech that stores >100mb on a platter, and charge the same retail for it as the SQ-555. I do not know if this means the same price to the customer in the end though. If someone could confirm/deny this, I would appreciate it.

rlee@weaver.ads.com (Richard Lee) writes:

- Um, Archie... John was asking about SPC, not SPS. Every program I
- have seen for displaying Spectrum pictures displays both SPU and SPC
- but not SPS; in recent e-mail he told me had found one. Meanwhile,
- _I_ have an SPS file I can't do anything with. Does SPSLIDEX in
- fact display or convert _SPS_ files?

There are *TWO* kinds of .SPS files. Typically, if the .SPS file is less than 51K, it's a picture and requires the use of SPSLIDEX to view it. SPSLIDEX also converts .SPU and .SPC to .SPS. When converting from .SPS, it spits it out as .SPU. Furthermore, Spectrum 512 will not recognize .SPS pictures, since SPSLIDEX was written by someone not affiliated with Trio Engineering. You must first convert them. Finally, files larger than 51K are Unispec animations. I have three and have never seen any others. These require the public domain program, ANISPEC, to view. These are 512-color animations.

Jeepers, maybe Dave could put this in the Tips and Hints section of "Welcome to CSAS?" I'd just better not let it go to my head. :^)

1941. Error when sending Pagestream's PostScript to Laserwriter

Newsgroup: comp.sys.atari.st
Date: 1990-09-18 05:42:00 UTC
From: steve@thelake.mn.org
Message-ID: <A88085810@thelake.mn.org>
Source record: 238560
Cross-posted to: comp.text.desktop,comp.lang.ps,comp.sys.atari.st

I've run into a minor but puzzling problem when sending PostScript
files generated on my Atari ST to an Apple Laserwriter.

I'm composing pages with PageStream, writing PostScript to an
IBM-format disk, taking the disk to a print shop, reading the file
into a Macintosh SE30 with Apple File Exchange, and sending the data
across an Appletalk network with the SendPS program.

All goes well, and the pages are printed nicely, but the end of each
file causes SendPS to pop up a dialog and complain about an illegal
PostScript command that looks like this:

%%[
*]%%

... where the * actually is a character that looks like a rectangle.

I ran a test through a Varityper VT600 last month and got an error there,
too, printed out on a sheet.

The tails of the PostScript files look pretty much like this
(at least when they leave my ST):

```
( ) 187 r
(n) 375 r
(o) 375 r
(t) 208 r
(e) 333 r
(s) 291 r
showpage
% End Tile
% End Page
```

... followed by control-D. Is there a PostScript problem here, or am I
perhaps picking up garbage in the MS-DOS-to-Macintosh translation?
Perhaps AFX or SendPS is converting the control-D to something else.

Source record: 238563

I have worked with a Spectre 128 V 2.65 and TOS 1.4 with System/Finder
V 6.02 with no problems.

I have also tried 6.04 and this also appears to work, but it is
rumoured to be instable. I have seen a Spectre 3.0 announcement from Gadgets
which indicates that 6.04 and 6.05 'now work fine' so I think these versions
may be instable on Spectre 2.65

From: dac@ukc.ac.uk
Message-ID: <5482@harrier.ukc.ac.uk>
Source record: 238565

Does anyone know what the latest version of SubLogic's Flight Simulator is? Has Flight Simulator III been released yet? If so, can anyone shed any light on the improvements over FSII?

Please direct your replies through mail as I doubt that this is of major interest.

Thanks,

Dave.

1948. proportional mouse accelerator

Newsgroup: comp.sys.atari.st
Date: 1990-09-18 09:29:59 UTC
From: verwer@ruuinf.cs.ruu.nl
Message-ID: <3808@ruuinf.cs.ruu.nl>
Source record: 238567

I finally upgraded to TOS1.4. It works fine, and fast, but there is one problem; The proportional mouse accelerator promouse.acc, which was posted to this newgroup some time ago, does not work anymore.
If there is a version of this program which works under TOS1.4, could somebody please email it to me? (I do have maccel2, but I don't like it since it is about 10 times as big as promouse.acc.)

Thanks,

|I have two questions that are somewhat closely related.
|
|First of all, I'm very interested in learning about MIDI.
|Some of my friends are musicians (although I'm not) with
|MIDI keyboards, etc., and I have an ST... a match made in
|heaven! I'm looking for a sequencer that's cheap, but can
|do all the basics, like editting and that stuff (you're the
|experts, you tell me!) Is there anything public domain?

Since I suspect this might interest other people too, I'll give my response here. I'm much of both a computer and a music fanatic, so that explains my interest in MIDI. This is long, so hit 'n' when it isn't appropriate for you!

It just happens that I am currently working on a full-fledged PD MIDI recorder for the ST. It is already in a useable state, and I would like to have some feedback before releasing it to the public. I'm looking for alpha/beta testers for this program; preferably owners of both a MIDI instrument and an ST. What I'd like to hear is what problems you did find, what was unclear, what you couldn't do with it and also what additional features you would like it to have.

If there is much interest (please reply by email), I'd rather send this version to Steven Grimm and collect additional ideas and suggestions from you all. I never used a commercial MIDI recorder - only read some descriptions - but maybe that is just a strong point. To give some indication of its (current) capabilities, a short description is appended (Eric: this will sound familiar!).

Cheers,

Leo.

--------8X--------8X--------8X--------8X--------8X--------8X--------8X--------8X

MidST has an unlimited number of tracks (well, memory is the limit) that you can set each to record/play/protected. Each track has its own input filter for MIDI messages (with which you can also control which channels it listens to). You can set this filtering per channel (en/disabling all messages for a channel), per type of MIDI message (en/disabling that message for each channel) or enable/disable exactly one message type for exactly one channel. You can define for each track a channel offset (e.g. if it's 2, then channel 3 is sent as channel 5), a tone offset and a time offset. You can also create so-called fake tracks, that are tracks that have no data of their own, except for the

offset data. In this manner you can get a fuller sound by say having a fake track on a different channel (by means of the channel offset) and an octave higher.

It is programmed as a (I hope) well-behaved GEM application; there are buttons for record, play, stop, fast forward, rewind, pause, eject (write to file), insert (read from file) and off (leave the program). Using these buttons will also send the appropriate messages for song positioning, start/stop/cont sequencers. There is a metronome section, that deals with timing, clicks and bells; it also sends MIDI clocks to keep sequencers in pace. If told so, you can set it to listen to incoming MIDI clocks and get itself synchronized with them (e.g. you can use the speed control of your synth's rhythm box to control the replay speed of your recording; very nice). There is also a counter section that displays the current tape position in measures, beats and ticks (I use a 'tick' unit that is 1/10 of a MIDI clock in length). You can give a number of 'beats before' to get the right tempo before recording, or even start recording on the first note played. The display of both counter and metronome can be suppressed, which gives greater accuracy in replay (standard GEM drawing is slow).

There is a section for setting the scale; this is handy when editing note events. It also handles a global note offset which affects all tracks.

There is also a section to edit tracks: edit single events, enter by clicking on a keyboard display, wipe/cut out/merge/insert/replace /quantisize portions of tracks etc.

Planned: a monitor function that plays MIDI messages over the ST sound chip.

1953. Re: XBRA

Newsgroup: comp.sys.atari.st
Date: 1990-09-18 11:34:14 UTC
From: csbrod@medusa.informatik.uni-erlangen.de
Message-ID: <3111@medusa.informatik.uni-erlangen.de>
Source record: 238597

larserio@IFI.UIO.NO (LarsErikOsterud) writes:

>I see that some resident program use a standard called XBRA.
>Can anyone tell me more about this standard ?
Any program that steals some system vector must use XBRA to notify other
programs that it linked into a vector. To cut it short, an example in
assembler:

```
...
code to switch to supervisor mode
...
move.l $472,o_hdv ; get old vector value
move.l #my_routine,$472 ; link in own routine
...
code to switch to user mode
...
lotsa stuff, then, somewhere in your program:

dc.b "XBRA" ; XBRA id
dc.b "????" ; four printable characters to
; identify your program
o_hdv: dc.l 0 ; here you store the old vector value
my_routine:
own code that sits in the redirected vector
```

This way, a linked XBRA list is created if several programs link into
the same vector. As there is a standard place for the old value of the
vector, a program can retrieve this old value and thereby remove itself
from the chain. Programs can also detect if they already are linked
into a certain vector. Every program has to use some unique ID (????
in the example above) that consists of four printable characters.
If you want to use some ID, please let ATARI know that. In fact, I don't
know if ATARI monitors XBRA IDs right now; to be sure, mail your new
XBRA IDs to Julian Reschke (sorry, forgot his e-mail address - Julian,
would you please help out).

Super Conductor was a commercial program from Michtron, and is -not- in the
public domain. I would say that none of the programs you might find on a STart
disk are public domain, with the exception of ST Writer. You will have to
purchase the disk from Antic (or your local magazine salesperson) in order to
legally use the programs on the STart disk.

(This is also being e-mailed in case David R. doesn't read this newsgroup).

I have 2 PD sequencers one for monochrome called Alchimie Jr. and another for color called MIDISEQ (or something like that). I haven't used either much as I am currently using SMPTE-Track from Hybrid Art's. A friend of mine is quite impressed with Alchimie. Also if you don't want to part with too much money you might look at Dr.T's Tiger Cub (s.b. less then $100). I was playing with this on the weekend and was reasonably impressed.

3000- and 2.0-specific software? In the best of all possible worlds
there should be none. Some compute-intensive packages are available in
two versions - one of which has floating-point coprocessor code inline -
included in the same box. But one of Amiga' strengths is its
compatibility. Up and down the line, forward through OS revisions,
things that work on one Amiga usually work on all others. I would
expect that much software already works with AmigaDOS v2.0. Software
tweaked to work with v2.0 should also still work with v1.3. There is
much more "clean" stuff out there than Byte may realize.

On another note, there are freely redistributable software tools
available (Small C compiler, assembler, C function library) which permit
porting the Byte benchmark suite to Amiga. Since Amiga and Macintosh
have the same CPUs, I look forward to seeing a head-to-head benchmark
comparison in the Amiga 3000 review. Anticipating Tom Yager's
objection, the same has already been done with 386-based UNIX boxes vs.
MS-DOS machines, no?

> there any interface considerations? Printer drivers? Emulation?
> Does the DJ500 have a Epson LQ emulation? Or is there a DJ driver
> for Write? (Yeah, I know, I should get Word Flair...)

No interface problems that I know of. You will need a GDOS printer
driver. There are two available:

1) Migraph (Federal Way, WA -- no phone, sorry) sells a DeskJet
driver set that includes a screen-dump patch.

2) Neocept (Camarillo, CA -- 805-484-2041) sells TurboJet, that includes
drivers for the LaserJet, DeskJet and the Atari SLM804,
and the OUTPUT program to print .GEM metafiles.

I have used the Migraph drivers with MSWrite and they work fine. Other
people tell me that they've used TurboJet with MSWrite and it works
fine, also. Both cost around $40. Do yourself a favor and buy a registered
copy of whichever one you choose.

You can still print without the drivers, if you use the "generic" ASCII
printer .PRD file -- no italics or anything, mind you, but okay for
program listings and such.

There is an Epson cartridge available for DeskJet series printers. Cost is
around $90 list price. Your dealer may be able to give you a break on it.
It includes a proportional-spaced Times Roman font, prettier than the GDOS
one (IMHO).

> And I remember a problem with some Ataris and DeskJet and the
> parallel port?

That's a new one to me! At HP Corvallis, we've had a 1040ST connected to
DeskJet series printers for years (no exaggeration!) with no problems
whatsoever. The 1040ST and the HP DeskJet/DJPlus/DJ500 are a perfect match.
Enjoy.

I have a very nice version, call GOMOKU from some company called Mindgames.
I don't know the specifics off hand but can look them up (I have the
box back home) so let me know if you want details (like the address
of the company) and I will dig them up.

Ok just so I dont have to write alot of Mail to everyone your ST isnt dead most likely its your internal power supply. The symptoms of a failing power supply, include having to reboot many times before normal operation, repeated bombs on bootup, erradic working one day and not the next, Lockup during ST operation. Of course there can be many other reasons eg bad ram chip etc. But from running a bbs for 5 years my number one problem was simply bad power supply. So to confirm this on a failing power supply or one thats about to go, get out your multimeter and check the power coming out of the leads going into your ST. If they are 8-10volts for the 12 volt line and 2-3 volts for the 5 volt line your power supply will act erradic if at all. PS NOTE dont play with your power supply without knowing something in electronic or you get a nice Zap or worse blow your keyboard chips. So if you are not techincally inclined borrow a friends ST for a day switch power supplies and see if that solves your problem. If it does you have two options buy a newly designed power supply from atari or fix your existing one. If you plan to fix your existing one you can start by replacing C12 or C13 large capacitors 2200 and 4700 pf and if that doesnt help I have replaced C11 and c12 on older model power supplies. If anyone has any questions leave me mail. Hope that helps.

Hardware Dave at your Service

Actually, Gomoku is the regular name of a game that is played using the same board and markers as Go, but is much simpler than Go. Unless Mindgames is confused (or I am), I don't think this will satisfy Kenneth.

1966. Re: AVANT-GUARDE out of business?

Newsgroup: comp.sys.atari.st
Date: 1990-09-18 20:12:40 UTC
From: david@doe.utoronto.ca
Message-ID: <1990Sep18.201240.2910@doe.utoronto.ca>
Source record: 238584

May I propose a new news group:

alt.flames.pc-ditto

Votes? (Just joking).

Seriously, with XT clones weighing in at around $700, it's not too economical to invest in emulation -- unlike Mac emulation. This is in no way intended as an insult to the hundreds (thousands?) of people out of money because of Avant-Guarde's big promises and small delivery. I came close to buying it myself, except that I was too poor too at the time. Perhaps group therapy might help.

David

Could we please move amiga discussions to an amiga group? This newsgroup is called "comp.sys.atari.st" and is for discussion of _Atari_ products. The article I am following up on contained nothing but Amiga drivel. There are more Amiga groups than Atari groups, is it asking too much to keep discussion there?

No slight intended towards Migraph. When I said "no phone", I meant that
I didn't have their phone number handy. Migraph do indeed live in the
20th century, and you can get their phone number from directory assistance.
They're in Federal Way, WA, near Seattle.

Regards
Ray

(this is primarily addressed to Dave Small, and company)

I have been told that MacII (that is, color Mac) emulation is not
likely to be forthcoming, due to the "deathgrip" Mac has on the color ROMs.
What I was wondering is if SE emulation would be at all likely as a future
enhancement to the Spectre line? Would SE/30 emulation be possible with the
(near) advent of the TT? Or does Mac have an equally tight "deathgrip" on
those ROMs as well?

1970. 39 Games for Mono Monitors! (Many run in colour too!)

Newsgroup: comp.sys.atari.st
Date: 1990-09-18 22:23:56 UTC
From: 7103_3654@uwovax.uwo.ca
Message-ID: <7024.26f6663c@uwovax.uwo.ca>
Source record: 238588

What started all this....

Short Excerpt from "My Life Story":
On April 1, 1989, I ran home from the computer store with an Atari 1040ST; my very first computer! As I quickly learned the computers without software were not that amusing, I took to hanging around computer stores to see what there was to buy. When my focus settled on games I realized the awful truth: commercial games are primarily written for @*~'%# colour monitors!

One year and one month later, it occurred to me that not only was I shunning computer stores and their commercial software, but that I was now having trouble finding enough time in the day to play all my games. Sigh...

Well, that's how it is. There are quite a few monochrome games out there and many are free! A large percentage of them find their way over from Germany and some kind bilingual soul takes time to translate them into english.

Below is my list of all the monochrome games which I've run across since April of 1989. I've organized them alphabetically into two groups. The first group contains games which run on both colour and mono monitors. The games in the second group run on mono monitors only. I've also added information about the games -the version number (if known), the name of the archive in which I found the game (if it differs from the name of the game), the locations where I remember seeing a copy of the game, etc...

The locations where the game can be gotten will be given by one or more of three letters:
"L" denotes my local BBS 'LUST' (London Users of STs) 519-432-5514
"A" denotes the ftp site 'Atari.archive.umich.edu' (141.211.164.8)
"C" means that the game appeared on comp.binaries.atari.st (and so it will be available at many archive sites, including Atari.archive.umich.edu)
I don't claim that these letters are exhaustive, but it will give people a place to look.

PLEASE NOTE: The descriptions given with each game reflect my personal bias; as well, some of the games I've rarely played. I've tried to write a little about each game to give the reader some idea. So don't just go by my assessment of a game, try it!

If I've missed a mono PD or shareware game which you've enjoyed playing, please let me know. I'd like to make this list as complete as possible and will post it again sometime down the road.

Adele

---------- COLOUR AND MONO GAMES----------

AIR TRAFFIC CONTROLLER (C)(atc.arc) Be an air traffic controller without endangering real lives. Several different scenarios available. Shareware.

BOLO (L and A) A commercial quality breakout type game. Excellent. Lots of attention to detail. Also look for the program 'Bolofix'; this program will adjust Bolo to play at the correct speed on North American monitors. Bolo is mouse driven.

GNU GO (C and L)(version 1.1) Play a game of Go against the computer.

GREED (C and L) Game of strategy. The entire (well, almost) screen consists of row after row of numbers (0-9). You move the cursor over this array of numbers leaving a black trail. You can never cross this black trail, neither can you leave the array. Stepping on a number, say 6, moves you 6 places further in that direction. The object of the game is to leave a longest trail possible before you run out of legal moves. Public domain.

KENO (L) This seems to be some sort of betting game. Unfortunately, the rules are not included.

MEGAMAZE (A and L) A 'Gauntlet' type game. With your sword and magic missiles (arrows?) try to find (and fight) your way out of a maze. There are many objects which will help you and many monsters which will try to hinder you! Game requires a joystick. Shareware.

MEGAROID (L and A) Really nice remake of the popular video game Asteroids.

NETHACK (C and L)(version 3.0) I love this game! Nethack is a substantial "Dungeons and Dragons type" game. Has an amazing level of intricacy. There is a group "rec.games.hack" devoted to discussing the game and strategies.

SPACEWAR (L and A)(version 3.1) Two player game, one person is the USS Enterprise and the other commands a Klingon ship. Players try to annihilate each other with torpedoes and phasers, but be careful to avoid the sun....

SOKOBAN (C) Push barrels around a maze and into a holding area. The catch is that you must get behind and push the barrels and cannot pull them; thus one must be careful not to move barrels so that they become 'stuck'.

ST CONCENTRATION (C and L)(St_conc.arc) Plays one to four people. Based on the popular TV game show. Here you have 80-100 cards lying face down. You turn two cards over at a time and trying to pick them identical. The point is to remember the location of as many cards as possible while looking for their partner. Nicely done. Public Domain.

TESS (C) This is 'Beyond The Tesseract V2.0p' a text adventure game. From the docs: 'The scenario for the adventure is meant to be vague. Once the adventure has been completed, the scenario will become clear. This adventure is abstract and a bit on the technical side. Detail knowledge of the technical background is not necessary, although it will make the adventure more enjoyable.' Public domain.

ULARN (L) A Dungeons & Dragons type game that's simpler and quicker to learn than Hack or Moria. For days when you don't have the patience to play Nethack or Moria carefully.

UMORIA (C)(Version 4.87, I hear that version 5.0 is being beta-tested now) A substantial Dungeons and Dragons type game. I haven't played it often, so I don't know how it compares with Nethack. My feeling is that Moria is a bit slower paced. A popular game, there is a group 'rec.games.moria' devoted to discussing Moria.

WANDERER (this will be posted to "A" in the near future. It's not quite finished being ported.)(version 3.2) Off you go wandering through cavernous areas picking up diamonds left and right. You must pick up all the diamonds before advancing to the next screen (there are over 60 screens in all). This diamond collecting business is not that straight forward -each screen is effectively a puzzle. You must figure out how to get at diamonds without trapping other diamonds and without getting eaten or killed. Program has online help. Fun and challenging.

YAHTZEE (this will be posted to "A" in the future. It's not quite finished being ported.) This is the game of yahtzee for the Atari ST. The program will take up to 6 players, some of which can be the computer itself. Program has good online help. Public domain.

---------- MONO ONLY ----------

ALFRED'S KISTENLAGER SCHIEBERIEN (L)(Aks.arc) Push barrels around a maze into a storage area. Looks to be the same game as Sokoban but with much nicer graphics. This game is in German, but comes with an file English.txt which explains the game.

ANDURIL (L) Try to find all the pieces of the broken sword while searching through the maze. (If you've read Lord of the Rings, you know what 'Anduril' was.) Public Domain.

AWARI (L) Play a traditional African pebble game against the computer. Program contains the rules. Easy to learn the rules, not so easy to beat the computer! Shareware.

BANDWURM (L and A) Guide a worm around a playing field so that it can eat little pellets. As it eats pellets the worm GROWS. Trick is to successfully navigate the worm without having it run into walls or itself; this task gets harder and harder as the worm gets longer and longer.....
This German program comes with a file English.txt which tells you all you need to know.

BOUNCING BOUBLES (L and A) (Bouble.arc) An excellently done space invaders type game. Rules flash on the screen in German, but you will have no problem noticing which keys do what. Be careful of running a screen saver while playing this game; my experience has been that after 3 minutes, my screen saver comes on and then Bouble crashes. Game played with keyboard or joystick (the keyboard is faster).

COLUMNS (C and L) A tetris-like game, but harder. There are falling columns which are built up of 3 blocks. Each block can have a different pattern. You can rotate the 3 blocks (change the order of the pattern) and you can also move the column left or right. When the column falls on the heap and there is a sequence of 3 or more blocks with the same pattern, then these blocks disappear. Public domain.

DRACHEN (C and L) (version 2.0) German version of the game of Mah Jong. The idea is to pick up tiles two at a time. Only tiles which match may be picked up together. To add spice to the game, you play against the clock. Excellently done. Look for a file "Drachen.eng" which explains the rules in english. Mouse driven.

EXTENSOR (A and L)(version 3.3) A "Tron" style race game; select different obstacle patterns, number of drones, variable or constant speed, etc. No docs. If you don't have a joystick you can use the cursor keys as well as <a> and <q>. If using a joystick, move it up or down to change speed and left or right to change direction. Catchy music. May not run from a folder. Public Domain.

GO BANG (L and A)(version 3.1)(Gobang.arc) Play against the computer by trying to get five of your stones in a row. Game also known under the name Go-Moku and is played on the traditional Go mat. Freeware.

GO UP (L and A)(goup.arc)(version 1.0) A nicely done 'Lode Runner' clone. Plays slightly different than 'Runner's Revenge' listed below, so get both! There is a working level editor. Plays one to four people. Play with either mouse or joystick.

KRABAT (L and A)(version 0.0a) Play chess against the computer. The pieces are nicely constructed. Krabat looks for the folder 'Pictures' in the root directory.

MACPAN (L and A)(macpan1.arc or Macpan.lzh) German mono version of Pacman. Play with either a joystick or the keyboard. There is a special two-player option whereby both players are playing at the same time while competing/cooperating for points. The main screen has been translated; as well, there is english file outlining the game. Public Domain.

MINES (C and L) Mines is a game of strategy concerning the safe crossing of a mine field. The field is a rectangle of 16 by 16 squares. Some squares contain a hidden mine. The only clue given about the position of the mines is the number of mines within 1 square distance of your present position. Try it!

OPUSNR1 (L) A vector graphic fly-through shoot 'em up maze game.

PATIENCE (C and L)(Version 2.13) A well thought out program with an excellent demo mode. Play up to 6 different versions of solitaire. Originally in German, there is an English patch available.

POOLMONO (L) Pot as many balls as possible before losing your three goes.

PUZZLEPUZZLE (L and A)(puzzle2.arc) German Jig-Saw puzzle game with a twist. Completing a puzzle is like taking a step in a maze; depending on which of two buttons you choose, you go to a new puzzle and step further into the maze. The idea, I think, is to solve your way out of the maze. The puzzles you complete are actually 'linked' to one another in a clever way. Fun. Shareware.

RISK or RISKY (L)(Risk.arc is the Dutch version; Eng_risk.arc is the english one) Very similar to the board game Risk. Try to conquer geographical areas by moving your armies around (you can tell that I haven't played this often). Up to 6 players are allowed and they can be any combination of humans or computer generated players. The english (translated) version has only one map, the Canary Islands; whereas the Dutch version includes other maps. Look for a file "Feud.arc", this is another (english) map for Risky. The game comes with an editor so you can create new scenarios.

RUBIC'S CUBE SIMULATOR (L and A)(rubic.arc)(version 1.2) Simulates playing with a rubiks cube. Now when your mechanical cube breaks, you can run to your computer. Comes with lots of options; however, I haven't tried it.

RUNNER'S REVENGE (L and A)(Runner.arc) A Load Runner type game; get all the eggs lying around the 'maze' without the bad guys catching you. Run up and down ladders, dig holes in the ground to trap the bad guys or to allow you to pass through the floor to the next floor. Lots of strategy involved as well as good reflexes. A well done game. The game comes with a level editor which doesn't work in TOS 1.2 (I presume that it works in 1.0.). The game works in higher levels of TOS. Runner looks for the folders "sounds", "screens", and "sprites.img" in the root directory. Game requires a joy stick.

STETRIS (C) This is Tetris for the ST. Move falling objects so that they land creating a solid surface. Nicely done. Created by the same person who made columns. Public domain.

SUPER BREAKOUT (A and L)(Sbreak.zoo) This is a must-have! Monochrome version of the popular breakout games. Includes every option I've seen in ANY breakout game and over 200 screens. Includes an editor so you can create your own levels. Game is mouse driven.

TETRIS and TETRIX (C) Two more Tetris clones. Tetris has more options, even a "robot" to help you play. Tetrix is a somewhat more primitive version

with "keyboard graphics".

1971. PD Lisp?

Newsgroup: comp.sys.atari.st
Date: 1990-09-18 23:07:50 UTC
From: fsdmb3@acad3.fai.alaska.edu
Message-ID: <1990Sep18.230750.23210@hayes.fai.alaska.edu>
Source record: 238590

I am looking for a Public Domain (or cheap) Lisp interpreter (though
a compiler would be better). I am doing Expert Systems research and
would like to bring my work home with me to my ST. FTP would be best, include
the path name so I can actually find it.
Thanks for any help you can give.

ALSO: is there an UnLZH program for the IBM? I need to download an LZH
compressed file onto an IBM floppy but it won't fit (360K). So it would be
nice to be able to split it up on the harddrive with UnLZH. Any Ideas?

1972. Announcing a new multitasking system for the ST

Newsgroup: comp.sys.atari.st
Date: 1990-09-18 23:11:52 UTC
From: 7103_2622@uwovax.uwo.ca
Message-ID: <7026.26f67178@uwovax.uwo.ca>
Source record: 238591

I've just sent the sources and binaries of MiNT version 0.6 to comp.{sources,binaries}.atari.st. MiNT is not TOS, but it's a multitasking extension for TOS. It provides a number of facilities that are limited or lacking in other multitasking environments for the ST, including:

-- pipes, named fifo's, and pseudo-ttys
-- signals, including kill(), signal(), sigsetmask(), and sigblock() system calls
-- process groups and job control
-- resource limits
-- process priorities
-- fork() and vfork() system calls
-- new devices: midi, null, mouse (Sun-compatible), tty, and fd0-fd2 (for accessing stdin, stdout, and stderr through the filesystem); these, and the normal con, aux, and prn devices are accessible through files on a fake drive V:
-- processes are available through drive X:; deleting a process kills it, and they may be renamed just like TOS files
-- all system calls are accessible through the GEMDOS, BIOS, and XBIOS traps, so it should be easy to write MiNT programs with any existing ST compiler
-- supports the TOS 1.4 "fastload" bit, CTRL-ALT-DEL for rebooting, and fixes some TOS bugs (including the infamous I/O redirection bug)

MiNT can run GEM programs, but no more than 1 at a time (you can have a GEM program and several "plain" TOS programs running simultaneously). You can run MiNT as an AUTO folder application, or stand-alone. This is a problem with GEM, not MiNT; other window managers don't have this problem (e.g. the MGR window system runs under MiNT, and it should be quite feasible to port an X server and clients to MiNT).

Comparisons with MicroRTX, and Minix are, I suppose, inevitable; but they're probably not helpful. Minix is a whole new operating system, based on Unix V7, and not at all TOS compatible. It's quite nice, but I find that I've spent a lot of effort to get a nice TOS environment, and I don't want to have to re-invent the wheel with Minix. Moreover, with MiNT one gets some nice features from BSD Unix (like job control, safe signals, and pseudo-ttys) that Minix is lacking.

MicroRTX is TOS compatible, but I see it as being aimed at a different group of users. MiNT is not real time, and is not a supported commercial product, so obviously there are some people who will find it inferior to MicroRTX for these reasons. On the other hand, MiNT is more like

Unix, which should make it much easier to port programs to it.
MicroRTX lacks most of the features listed above; on the other hand,
MiNT lacks a number of features of RTX (such as the real-time extensions,
and message queues). If you're an experienced programmer and you like Unix,
you'll probably like MiNT. If you don't like Unix, you may prefer MicroRTX.
If you don't program, you should use whatever best supports the programs you
like. I think the two systems can co-exist. (They even share a (very few)
system calls).

Also, MiNT is freeware, *not* a commercial product or shareware; and it
comes with all the source code. I would encourage people to tinker
with it, improve it, and fix bugs. My hope is that MiNT can become a
reliable alternative to TOS for people who want a more Unix like
environment.

1973. Re: TT RAM

Newsgroup: comp.sys.atari.st
Date: 1990-09-19 00:21:46 UTC
From: apratt@atari.UUCP
Message-ID: <2304@atari.UUCP>
Source record: 238592

csbrod@medusa.informatik.uni-erlangen.de (Claus Brod) writes:

>Is the TT's memory mapped by the MMU so that it appears
>contiguous?

No. There is no address translation going on in the MMU. If there were, every program that wrote an address into a chip (video, DMA, etc.) would have to be able to do the logical-to-physical translation. This is impractical, and would result in nearly 100% incompatibility with existing programs. The MMU is used, however, so don't mess with it. It's used to get around a bug in the 68030's design; I may explain in more detail later.

>I need this info for my hard disk driver which has to
>decide if some transfer is to be made into fast or slow RAM.

Right you are. That's what the _FRB cookie is for. But you are looking at the problem in the wrong terms: rather than deciding what kind of RAM the transfer is destined for, your program should decide only what it has to: in this case, decide if it's being made to/from a place that the ACSI DMA chip can access. This prevents you from hard-coding the location or size of different pieces of RAM. This saves you from having to re-release your driver when somebody complained that he couldn't access VME RAM with it, because you didn't think of that.

The ACSI DMA chip can access memory only in the low 24 bits of the address space, so that's your answer: you check the high byte of the transfer address. If it's zero, you can use ACSI directly. If it's not, you must use the FRB. You never examine any part of the address other than the high byte, and you only test that against zero. Minimizing the information you require in this way leads to maximum portability and future compatibility.

As an aside to SCSI driver writers, you have less to worry about. As mentioned above, the definition of accessibility on the ACSI bus is "the high byte must be zero." The definition of accessibility on the SCSI bus is "the bus must be 32 bits wide." This means that A24/D16 VME memory is not accessible to SCSI, and you should use the buffer pointed to by the _FRB cookie.

Finally, to defeat nit-pickers before they strike, I *know* that the ACSI DMA chip can't really talk to everything in the 24-bit ST address space: it can't see ROM, for example. But it *can* access any real RAM in that space, and if you're trying to DMA to something else (like the palette) you deserve what you get.

(nice job Ken B. !)
magic.lzh - makes the mouse pointer "sparkle" as you move the mouse
opusnr1.lzh - Game: opus number one, mono one. Seek and destroy the
enemy glider. Nicely done 3-d vectors.

When posting about recent uploads, please make sure you spell the name
correctly! The directory is unreadable, so the only way anyone can
find it is if they know the filename. "maccel33.lzh" is actually
stored there as "maccell33.lzh" (note the extra "l"). I found this by
experimenting, and got lucky.

nick

p.s. Why on earth is the directory unreadable? That's nuts!

>
>Mikko

Yeah, I use a Talon Omniswitch with my multisync monitor. Works OK, although the image is smaller than I'm used to. (14" monitor, .25mm dot pitch.) With overscan, the 732x480 display is pretty decent. Color mode is just fine, of course. No problems with monochrome either. If you're going to build your own cable for the purpose, just bring the monochrome out signal from the ST video connector to all 3 R, G, & B inputs of the monitor. (Along with the rest of the sync & ground stuff, of course.)

Message-ID: <3116@medusa.informatik.uni-erlangen.de>
Source record: 238520

Sorry for wasting public bandwidth with a question that should go to
Dave Small - I don't know how to reach him here but I hope he reads
the conference. We are using some beta version of the new HyperCard
for some university project; we can't use the old version because
there are some things that those HyperCard freakies badly need in
the new version.

Some of these beta versions, among them all of the newer ones,
won't run right under Spectre. Anytime you're typing a space char
in a command, you get an error msg from HyperCard. Dave, did you
hear something like this before? Is there a patch? I asked one of
your German distributors, but he couldn't help.

1981. Fattrib and detecting directories

Newsgroup: comp.sys.atari.st
Date: 1990-09-19 12:42:07 UTC
From: jmw@tasis.eecs.utas.edu.au
Message-ID: <1752@diemen.utas.edu.au>
Source record: 238522

Is Fattrib able to report on directories? According to my MWC doco a subdirectory is indicated by the bit pattern 0x10 encoded in the return value, but whenever I give it a directory Fattrib fails with a return value of -36 (file not found).

I want to be able to detect the presence of a directory so I can create it if it is not there. So far the only way I have been able to get this to work is by calling Dcreate. If the directory doesn't exist I get a return value of zero for succesul creation; if it does already exist I get a return value of -36 (again). Is this the _only_ way to get that error?

Any suggestions would be much appreciated.

Thanx all,
John M Williams jmw@tasis.eecs.utas.edu.au

>Atari. I have always like Atari, and I will stand by it because of it.

Yuk, just because it's got a copper and super-flickery modes doesn't
mean its better.

In order to have a decent Amiga system you need loads of memory (to run
more than one program at a time), need more than one disk drive or a
hard drive and a monitor to access the migrane-modes.

Personally, I've never needed one of AmigaDos' biggest selling points -
the multi-tasking, although I realise that all Amiga owners play
Populous while they run massive ray-tracing sessions. (Well, actually
you can't do both those things on the Amiga at one time but we'll keep
quiet about that so that people think you can).

>Your margin of error is pretty big: The Sparcstation SLC will cost around
>12000 DM (in words: twelve thousand DM). And its a diskless, fanless SPARC
>workstation - not much good for the home user without a server, eh.

Get your facts straight before posting. It prevents embarrassment.
Look on the back of a SLC. See the SCSI port? Guess what plugs in
there! Why, SCSI peripherals - imagine that. Disks and tapes and all
kinds of clever stuff. But *not* servers. They (servers) plug in the
ethernet connector, also supplied on _all_ Suns; but you don't have
to have a server if you've got local disk... (the sun I'm posting from
has 650 megs local and no server).

Also: SLC's can be had for less than $3.5k - shop around. Bluntly, no
CISC box that I know of now can be justified on price/performance
grounds when compared to (almost) any MIPS / SPARC / 88K / generic
RISC machine, unless you already have a large body of non-portable
software. But that particular arguement can also be used to justify
IBM 3090s and all manner of like overpriced beasties. 68030 boxes
essentially don't cut it. The TT was born dead, but Jack & co aren't
going to tell anybody :-)

1990. Re: What's up with STart

Newsgroup: comp.sys.atari.st
Date: 1990-09-19 17:40:08 UTC
From: don@col.hp.com
Message-ID: <16830002@col.hp.com>
Source record: 238507

Bill Shroka writes:
> .... A local Atari
>store in my area has contacted STart as was told that they are combining
>STart and Antic into a single magazine. This, and the process of taking over
>the subscriptions of other defunct ST mags, has caused a delay in publishing
>STart. I'm not sure when they will be back up to full speed.

I find this rather sad. When STart first began publication, it was to be a magazine for programmers and people developing new applications for the ST. One of it's stated goals was to be chock full of source code listings on the (almost mandatory) disk. It was to be a quarterly, and was NOT supposed to include beginners tips, simple BASIC programs, or the like...these were to be left to the other ST magazines, including the ST columns that were to remain in Antic. Reviews were only to be minimally included, and were to be more things like an article comparing all the available C compilers for the ST, etc.

Based on it's stated goals and first issues, I subscribed enthusiastically. However, with the passing of time I've noticed it gradually turning into just another ST games review magazine. (In fact, even with all the noise, the ST notes groups lately have been carrying more technical info than a typical issue of STart!) In the quest for more circulation and larger revenues and a broader reader base, they have lowered themselve to the common denominator, and in my opinion, anyway, killed all that was good about the magazine originally (especially when they went monthly and had to start including fluff as filler to pad out the issue to make it look a reasonable size). With Antic now merging with it again, it looks like the end of it's usefulness is about to be completed.

Sorry for the dreary diatribe, but I felt a eulogy was in order. Now for my question: Does anyone know of a magazine for the ST, published anywhere in the world (preferably in English, but other languages are okay) that still does what STart started out to do? ie, are there any ST magazines that still publish programming tips, source code, hardware mods and upgrades, and articles on novel applications for the ST? If so, could you please email me information on how to subscribe to that publication? If I get any useful answers, I will post a summary.

Thanks!
Don Allison

1991. 68030 cache, write-allocate, and everything.

Newsgroup: comp.sys.atari.st
Date: 1990-09-19 18:52:43 UTC
From: apratt@atari.UUCP
Message-ID: <2308@atari.UUCP>
Source record: 238508
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Okay, for you chipheads out there, here's the scoop:

The 68030 design bug I mentioned is in the cache logic. I/O space must be non-cacheable, so there's an INPUT to the 68030 called "CIIN" for Cache Inhibit INput. That line is checked on all reads, but it is NOT checked on writes.

There is a bit in the cache control register called "write allocate:" when set, some writes to memory create an entry in the cache.

If you write to I/O space with the "write allocate" bit on, the write can cause a cache entry to be created, even though the memory in question is non-cacheable. A subsequent read from the same address hits the cache before the CIIN is checked, so you get stale data.

This only happens when you do a longword write at a longword boundary in I/O space, then read back any part of that longword before the cache line is re-used. You will read what you wrote, instead of reading what the device puts in its register. If it's a read/write register that the device doesn't change, you won't notice, but if it's the kind of register that means one thing when written and another when read, or if the device changes the value in the register, you will get bitten.

To fix this problem, we use the MMU to map all addresses to themselves, but we set the "cache inhibit" bits for I/O space. The MMU's "cache inhibit" bit *does* get checked on writes, not just reads. This does not affect performance (much) because the MMU has a cache of its own, to remember recently-used address translations. Almost the whole table used by TOS fits in this cache, so the MMU won't be walking through memory very much translating addresses. We've timed it, and it just doesn't hurt that much: maybe 1%.

The write-allocate bit is used by TOS so you can access the same memory in user mode or super mode and it won't confuse the cache. If you don't set the write-allocate bit, you could write something as supervisor, write it again as user, then read it as super and get the value of the first write, not the second one. This is a side-effect of the write-allocate bit, not its primary purpose.

It's hard to find, but all this stuff is in the 68030 manual: the section in Chapter 6 (the cache) called "Write Allocate" is on point, as is the whole MMU chapter. Don't get clever with the MMU, though, because we're likely to want to use it in the future.

Well, I can't speak for the people at atari.archive, but it makes sense to me.
This prevents people from pulling things from the archive before they have
been tested by people there. I'm sure if someone got a virus from the new
directory they would be screaming at the archive people, even though it's not
at all their fault. It also prevents people from (accidentally or otherwise)
deleting files from there. I personally don't think people should announce
that they've posted things there until they have been moved to their
appropriate locations for the above reasons.

Try to remember, "ftp is not a right, but a privilege". They can run it any
way they please.

Don't remember needing loads of memory to run more than one program. Stock
Amigas w/ 1 meg memory seem to multitask fine. A500 comes with only 1
built-in drive so that must mean it works fine for those people that
have the A500 and no external drives. Who doesn't need a hard drive
these days???? There is a flicker fixer available for the "migrane-modes" and
I would like to see you try working w/o a monitor..8-)... Of course, you need
an expensive multiscan monitor to work in high resolution unless you want to
stay in low resolution for the rest of your computing days...each to his own
I guess.

Actually Populous will not multitask or allow any other programs to run
with it but that is because it is a game that wasn't designed to multitask.
Actually some people do ray-tracing on Amigas, though I am not one, and they
seem to enjoy multitasking. Don't know about you but I wouldn't want to
sit there watching a screen computing the ray-trace but with multitasking
you can let the ray-trace work in the background and do something else
with the computer. Everyone that I know that are used to multitasking
are very unhappy to go back to a single tasking system. Of course those
that haven't used multitasking just can't understand why it's important for
computers to have multitasking available. Just look at IBMs, Macs, even
STs and how much they are trying to get a functional OS that multitasks.
I still remember years ago, when the A1000 came out and everyone was saying
what do we need multitasking for, now it seems quite a few naysayers are
now pushing for it.

1994. fax and mega st

Newsgroup: comp.sys.atari.st
Date: 1990-09-19 19:25:53 UTC
From: russ@wpg.com
Message-ID: <3056@wpg.com>

A friend of mine runs his law practice with a mega st and wants
to receive fax's via his st and laser printer. How is this
possible? What sort of additional equipment would be required?

Thanks in advance. :-)

1998. I wanna do stuff remotely

Newsgroup: comp.sys.atari.st
Date: 1990-09-19 21:02:00 UTC
From: psurge@cs.utexas.edu
Message-ID: <12679@cs.utexas.edu>
Source record: 238513

Is there a program shell that will allow me to call my ST over the phone and have it run programs remotely, similar to what we do on Unix. I would prefer to know about free/share ware programs, but also would like to know if programs such as Minix will do this.

I assume the only programs that you can do this with would be TOS programs, seeing how GEM would not work over the phone. I am thinking along the lines of running ARC or any other .ttp program to de-arc files while I am sitting at work.

I also downloaded a file called UNIXTK.ARC or something from Terminator, but there were no readable instructions inside. Could someone please tell me what all those files are for? I recognized many with Un*x command names, but still don't know what they are all for.

Thanks.

Oh, either send me e-mail or post it to the NET.

Sorry to tell you Petra sad news for Amiga owners

Third quarter report from ST Report says Amiga had a 3.5 Million dollar lose for the 4th quarter of 1989. Oh well that burst another bubble in commodore earnings and losses. Personally I feel sorry for former Amiga employees at bankrupt commodore stores across Canada. If these stores closed shop that means less dealers to sell their products, which in turns means lost revenue.

Hardware Dave

Just stating the facts!

>
>Yuk, just because it's got a copper and super-flickery modes doesn't
>mean its better.
>
Copper is better than nothing.
Super flickery mode also happens to be a very nice way to get 640x400
resolution on a standard(non multi-sync) monitor. I'm sure lots of
people can't afford one, so there you are. Infact, I have a multu-sync
without the flicker fixer, but I can reset the initial color settings
so that almost all the flicker disappears.

>In order to have a decent Amiga system you need loads of memory (to run
>more than one program at a time), need more than one disk drive or a
>hard drive and a monitor to access the migrane-modes.
>
True if you are doing lots of animation/ray tracing, but I think that's
true for any machine. Amiga certainly demands less then OS2, Windows 3.0
or Multi Finder. One meg is usually enough to run say, a Wordprocessor
and a modem software.

>Personally, I've never needed one of AmigaDos' biggest selling points -
>the multi-tasking, although I realise that all Amiga owners play
>Populous while they run massive ray-tracing sessions. (Well, actually
>you can't do both those things on the Amiga at one time but we'll keep
>quiet about that so that people think you can).
>
Aha! You think you don't need it. I personally thought that way also,
but since then, I've been using this 'feature' all the time, without
realizing it. For example, I use a terminal program to connect to Unix.
Usually, compiling takes long time for a big program. I can 'switch'
to my Amiga side, letting the Unix continue whatever it's doing, I can
get on with my own stuff. Also what do you do when you are copying
lots of files? I simply open another DOS window, and edit a file, for
example. The possibilities are endless. Once you are used to the
multi-tasking env. you won't live without it(well...)
I think I read something about TOS getting an upgrade so that it can
also multi-task. Try it, then tell me if you don't need it!

>issue and have not received the new issue yet. (grumble...grumble...)

Ok since not everyone has heard there will be no Sept Issue of Start
instead start and antic are merging to form a large new magazine for
October to include 124 pages of interesting articles for both computers
It is even planning on maybe covering the Lynx or Portfolio computers.
Some say its a step backwards other say its a vast improvement. I beleive
its a cost saving measure to keep 8-bit articles in the new magazine.
It wants to be known as the all encompassing Atari Magazine. So if
you have seen the October issue what was it like?

From: mg20+@andrew.cmu.edu
Message-ID: <MaxysHe00VIFI0hkV6@andrew.cmu.edu>
Source record: 238517

You should be able to copy the game by doing a *file* copy from the desktop, not a *disk* copy. I copied all of the stuff from the two single sided disks the game comes on to a double sided disk and it works fine.

Incidentally, many, many "non-copy protected" programs can only be copied as files. Seems there are a lot of weird disk formats floating around out there...

2007. HELP! STUCK IN SPACE QUEST!

Source record: 238518

Alright, I'll admit it, I'm stuck. (I never thought I'd post this type
of message!) I am playing Space Quest, chapter 1, the Sarien Encounter.
I'm on the Sarien ship, got my uniform, got my pulseray gun, and know where
the Star Generator is. Lost my helmet, shot a guard, talked to guard, kissed
guard, but I can't get any farther! If I walk into the Star Generator room,
I get shot, even if I'm shooting when I walk in. If I try to get the gas
grenades from the armory, the droid shoots me. I have:
keycard cartridge kit knife glass plant pulseray i.d. card.
My options, as I see them are:
- Keep trying to shoot Star Generator Guard
- Keep trying to get gas grenade
- try to fix the out - of - order elevator.

What am I overlooking? Help, please! My wife is getting tired of my foul
mood, and I'm losing sleep! - (hey, I know, it's just a game...)

Anyway, if you can offer me any tips, please email me. Thanks in advance.

I've just sent these files to atari.archive.

fuji.lzh - program for the AUTO folder that puts a spinning fuji
symbol in the left corner of the menu bar. Doesn't work
on the STe. Don't know about TOS 1.4. Accompaning desk
accessory allows you to control the speed. No slowdown
either.

pinhed17.lzh - Pinhead version 1.7. Supports the STe, 680x0 upgrade
boards and fixes some problems with DC Desktop and a
few other things. Also XBRA support.

colawars.lzh - An AVS demo featuring Pepsi and Coke. Really nice.
requires AVSPLAYR.LZH.

flxifast.lzh - allows you set the fastload bit on multiple files.

Should I be running Pinhead even though I have the fastload bit set
on all my programs? Is there any other advantage to it?

Message-ID: <59qRP1w163w@questor.wimsey.bc.ca>
Source record: 238548

Does anyone in the ST world know about sending ARC or LZH files via binary transfer, which is the equivolent of coding the ARC'ed file as ASCII text and then posting it as a "message"? Apparently sender needs to code the file appropriately, and the receiver must have the decoder... does anyone know of such a beast for the ST? If so, it might be made use of here!

It's also got a blitter which actually gets used; the "super-flickery"
modes do mean it's better... for those who need to work with video. The 3000
has a de-interlacer, the new Enhanced Chip Set for all Amigas will provide
hi-res non-interlaced modes. Amigas don't have to be rebooted to switch
resolutions, either...

>In order to have a decent Amiga system you need loads of memory (to run

The vast majority get by with 1 meg. Yes, more memory is nicer, especially
when you do a lot of multitasking. As far as needing a HD or more than one
floppy, I wouldn't want to run ANY system in a 1-floppy configuration.

>Personally, I've never needed one of AmigaDos' biggest selling points -
>the multi-tasking, although I realise that all Amiga owners play
>Populous while they run massive ray-tracing sessions. (Well, actually
>you can't do both those things on the Amiga at one time but we'll keep
>quiet about that so that people think you can).

Why can't it do this? Certainly on a 68000 machine you'll see a slowdown.
But you can set one task at a lower priority to speed up the other. Of course,
I can plug in a 68010, or an '020 or '030 board, or buy a 3000, for various
levels of speed increase. I have yet to see an ST running on faster than a
14MHz 68000, mostly, I assume, because TOS doesn't support the 0[1-4]0.
I can speed my system up anywhere from 5-10% for $10 (68010) to over 20 times
faster (even more for floating point) with a 50 MHz '030 board.
I never really 'needed' multitasking either... till I got used to it.
I'm lharcing some files right now, while running this term program, a text
editor with a >500K text file loaded in, an open shell window, and a directory
utility, as well as 4 or 5 little utilities I automatically run at startup.
My 3 meg machine reports (via one of those aforementioned utilities) that
I have 1953K free.

What about Atari's earnings for that quarter? Considering Amigas are
actually _selling_, I'd expect Atari has a lot less profit to work with.
Of course, Atari hasn't spent millions on advertising, a dozen or so major
new products, or large numbers of new employees. Haven't heard about
any stores closing in Canada, but here in the US they've just signed on
400 new dealers.

Good idea; I'll send it up later tonight or early tomorrow, when I get a chance. (And thanks for the compliment! I'm glad people are actually using it in the real world.)

> ps. Are we going to see a way to lie to process' about how
> much memory there is so that greedy programs can be
> forced to share? (Or did I miss a feature already in it?)

In 0.6 there's a system call to limit process' total memory, allocated memory, and CPU time. A standard utility ("limit") is provided that lets you run programs with limits enabled.

Other new features of 0.6 are: alarm(), pause(), and select() system calls, improved tty handling (^C and ^Z take effect immediately), and faster pipes and pseudo-ttys.

Of course. Binary files are regularly transmitted in the proper
newsgroup (comp.binaries.atari.st), encoded into ASCII with the
standard ``uue'' program, which is available for the ST, PC and
most other machines.

C, executable binary and BASIC versions of the companion decoder are
available from the archive-server@panarthea.EBay.SUN.COM.

It sounds like you need uue.ttp and uud.ttp. They are Atari binaries that mimic the Un*x uuencode and uudecode (used by UUCP). They convert binaries to slighly larger files consisting of only select ASCII characters (those which have an EBCDIC counterpart for one, so they can survive passage through an IBM gateway). These files can then be mailed (and also ASCII downloaded, if you don't have xmodem or kermit available). I believe I got mine via ftp from atari.archive some time ago. I have two different sets of binaries, one called uudecode/uuencode.ttp, the other uud/uue.ttp. The second set seems faster and more user friendly (IMHO). If you cannot find them, let me know and we can work something out.

|>
|> Mikko
|>
|>

Yes, and my recommendation would be to get a mono monitor and a color monitor, if you can afford the DESK SPACE. (Price is about the same) With three guns trying to simulate the effect of one, the image on an average-priced multi-sync monitor is not as sharp as the mono monitor, made by JVC, from Atari. So unless you absolutely can't afford the desk space and can pay for a better multi-sync monitor (ex: those from Sony and NEC), I would recommend getting two monitors instead.

[...stuff about multitasking...]
realizing it. For example, I use a terminal program to connect to Unix.
Usually, compiling takes long time for a big program. I can 'switch'
to my Amiga side, letting the Unix continue whatever it's doing, I can
get on with my own stuff. Also what do you do when you are copying

This is not multitasking. I do this all the time on my ST.
Multitasking involves multiple processes running on the same machine.
It has nothing to do with remote modem connections.

I think I read something about TOS getting an upgrade so that it can
also multi-task. Try it, then tell me if you don't need it!

There are several multi-tasking OS's available for the ST, in all
software categories (commercial, shareware, PD). They are not TOS
upgrades from Atari Corp. TOS is single-tasking.

2023. 8930 -- ste sound

Newsgroup: comp.sys.atari.st
Date: 1990-09-20 06:04:01 UTC
From: CATHRYN@bdt.UUCP
Message-ID: <5176@bdt.UUCP>
Source record: 238366

Well, the reason I know a 8930 exists is that I happened to have stumbled upon
the docs for the Covox PC sound board which contains the data sheet for 8930
-- which mention that the thing's 8910 compatible. The chip has both a
8910 mode and an 8930 mode. The pins of the 8930 sefCU~em to match the pins
for
the 8910 which I see in my ancient developer's kit schematic. So it might be
possible to plug in the new chip. The 8930 has 16 bit frequency control.
Duty
cycle registers for each channel. and a bunch of other goodies. (maybe
someone has already tried putting one in. Hmmm?)

>downloaded from atari.archive. Whenever I load the program, 75% of the time
>it will crash less than three cursor movements after I reach the town. Is
>this a well known bug, and is there anything I can do to fix it?

Apparently the ST's system clock is used in generating random events in
Moria... if you just boot up your ST cold, without setting the clock to some
value other than 00:00:00, the game will hang...

The solution is to use some kind of clock setting utilty, even the Control
Panel ACC will do, to set the time of day... once you do that, everything
should work fine...

Message-ID: <5490@harrier.ukc.ac.uk>
Source record: 238364

The subject line says it all. Come on guys! This Atari vs Amiga thing has been going on since time began. I think Atari owners know the advntages the Amiga has over the ST and Amiga owners know the advantages the ST has over the Amiga. So why has all this childish "my dad is bigger than your dad" type argument been going on for so long? I am an ST owner and think it's great! I have a 1985 TOS, I work on a colour TV, have only one floppy disk and 1Mb. I am very happy with my system. I have friends who have Amigas and they are very happy with their systems. Conclusion: everyone is happy. So, what's the problem?

Simple things can fire up this argument. Recently the very simple Petra thing was the spark that restarted the fire. Unfortunately this is one fire which looks like it will always burn. There are some brief periods when it looks like its about to die out, but then things happen, like new machines like the Amiga 3000 and Atari TT come out and it all starts all over again.

When quoting 32-bit specs. Why not try to state the plus points of a machine without saying "... but the ENEMY's machine can't do that"? Let people buy a machine because it has the features they need rather than because an articulate politician made them THINK the other machine wasn't as good. The alternative is to maybe persuade someone to spend lots of money on either a machine which has lots of fancy features they'll never use, or a machine which does not have the fancy features they may end up needing.

Naaaah... From a network full of intelligent, responsible professionals, maybe that's too much to ask. My old 1985 ST will always be better than your Cray... because it's mine.

Dave.

It could be DC Stuffer.

You can find it on archive-server@panarthea.sun.com in volume 3 of
the index. Panarthea will send You a copy if he gets a one line message like
'send binaries/volume2 dcstuff09'.

> does what STart started out to do?

I posted this to the net because I thought other people might be
interested. The magazine that I found has some nice technical articles
is ST World from the UK (not the one from Oregon). It has a very nice
programming column (Isn't it run by Mathew Lodge? and isn't he on the net?)
and general reviews. The letters column is a joy since it keeps threads
of letters going. If I remember correctly, ST World has gone quarterly
so I guess its even more like STart wanted originally to be.
You should be able to find it at most dealers and quite a few mail-order
dealers carry it.

Take care,
Marshall

First: I like the ST line. I like Amigas. I have friends with both kinds of machines. Let's stay friendly: we're between iAPX machines of the past and new architectures of the future (I think VLIW will beat RISC in the end, but that argument is for another time and place.....)
Thing about Amiga multitasking is that it was introduced slightly buggy at a time when the applications weren't really obvious. Now it seems to be pretty solid and the applications are ready, or close to ready.
Fortunately for the ST line, people inside and (mostly) outside Atari have obviously been watching. Right now I'd guess ST multitasking is about even with IBM PC multitasking: if you know enough and care enough you can make it work.

Jon Clarke replies:

Hi Aarron and all the others out there looking for the Atari CDar504 ,
CD_ROM player. *- WE HAVE NEW ROMS ON-LINE. -*

I am happy to report we have been running one on our BBS {STaTus BBS}
here in Auckland for over 9 months now. It is a cdar504 not the 500 you
mentioned Aaron. It runs all three of the cd_rom formats however we only
use the 'High Serria' and the "ISO 9660' format.

Many people have produced roms that will run with the cdar504. To name
a few we use on a daily basis on the BBS...

[1] Current Notes {American Magazine [and a good one]} Atari ST only
[2] D&C Enterprises Atari ST only
[3] Graphics Lab All computers MAC,IBM,Atari ST
[4] The Golden Immortal Atari ST only

There are other ST specific roms comming on the market like...

[1] Independant Association of Atari Developers {All ST related}
[2] Z*Net PD rom {I understand it may be 2 disks {1.1 gigs}}
[3] MirrorSoft {UK based games company}
[4] There are several roms available from Australia {sorry forget
their names}

I know of only one other user in the country who uses his cdar504 out-
side the dealer network and he is now in Auckland as well. This chap
used to run his cdar504 on his BBS as well when he had Tinkerbell going
Wellington. However there is something like 15 odd in use in NZ out side
the dealer network.

I rang Atari-NZ this to order another one for the BBS and was shocked to
see thay had all been sold, and they are awaiting the next shipment.

I know there are a few in Canada, Steve Gold uses one up there and we spent a little time with him and Bob Brody several months ago helping Steve get Metados sorted out on his system. One thing to remember here is that Metados is (C)opyrighted to Atari and is not PD!

If you are into serious DTP or a BBS I would suggest you get a CDAR504 as soon as you can!

Jon Clarke

```

Jon Clarke replies:

Hi guys, it is great to see that the cdar504 is selling up there. I have a few questions for you.

[1] What ROMS are available ?
[2] What is the cost up there? [Average $DM150 in New Zealand]
[3] Do you have any ording address for the roms at all?

We run the cdar504 on Michtron BBS version 3 done here. I am looking for as many roms as we can get for the BBS. We currently have 5 roms we rotate in the player, but soon we will have another one so it will a little easier for the users.

Do you have the same problems with the roms up there we have with the ones we get from the USA? The rom can handle 550 megs but most of them are only 90 megs on average. The one from Whitestar is 440 megs and this is the largest Atari rom I have seen to date. Some are only 35 megs!

Sorry folks!

DC Stuffer is in volume3 not in volume2 !

2036. newsgroups

Newsgroup: comp.sys.atari.st
Date: 1990-09-20 15:47:17 UTC
From: rjast1@unix.cis.pitt.edu
Message-ID: <40160@unix.cis.pitt.edu>
Source record: 238367

I'm new to this net, so I have a quick question. What newsgroups
(Atari-based) are available to read, other than this one?

rjast1@unix.cis.pitt.edu

Message-ID: <15330015@hpfinote.HP.COM>
Source record: 238525

> Personally, I've never needed one of AmigaDos' biggest selling points -
> the multi-tasking, although I realise that all Amiga owners play
> Populous while they run massive ray-tracing sessions.

I can counter this with a self-serving, overgeneralized statement:

"People who say they don't need multitasking have never really used it."

Right now, I'm running notes in this window while another window is cranking through a statistical report for me. When the report spews out the data I need, I will use a third window to pull the report into a troff document I'm composing. When I'm ready to send the troff document, I will start up my mailer. But to compose the distribution list, I need to look back through some old files to find the current addresses and pathnames for my colleagues. Some of the files are on another system, so I'll open yet another window to access that other system.

Meanwhile, notes is sitting patiently, waiting for me to get back to it. No games, no Tetris or Zork (at least, not on HP's time :-), just real work.

I used to have a DOS machine. I thought Windows 3.0 was a joke (still do), and I didn't think I needed multitasking either. I will LOVE IT when my home computer has a multitasking OS. (Until then, I still like my ST :-)

> there?

> ---jb
> ----------

I disagree. Except for the technical points of Amiga performance, what has
been said in this string applies as much to the ST(and TT) family as it
does to the Amiga family. This is a constructive string, which basically
addresses the problem of BYTE magazine's trend towards becoming yet another
PC-specific magazine clone. (Yes, that's where I meant to put "clone".)

I don't mind reading about Amigas occasionally. Sometimes the articles
contain information useful to Atari owners. (Like, for example, where to
get the last key in DM!)

Regards
Ray

2041. to Leo De Wit at Phillips -- MIDI sequencer

Newsgroup: comp.sys.atari.st
Date: 1990-09-20 17:27:19 UTC
From: rrd@hpfinote.HP.COM
Message-ID: <15330017@hpfinote.HP.COM>
Source record: 238527

Hi Leo,

I've been trying to get hold of you all week, but my email keeps bouncing back. Must be a cold front on the Atlantic coast or something.

I would love to serve as an alpha/beta test site for your MIDI sequencer.

I have a 1040ST with the original 1Meg RAM, and a Yamaha synthesizer. (It has only 2 MIDI channels. I'm trying to talk my wife into an 8-channel synthesizer masquerading as a piano!) I compose music as a hobby, not for performance.

I would be happy to test and evaluate your sequencer. I am familiar with the commmercial products SuperConductor (bleah) and Music Studio (limited usefulness), so I would at least be conversant with your sequencer.

If you still need some testers, please do not hesitate to write or email. You may have to resort to paper if the email keeps bouncing. :-(

>
>Actually, Gomoku is the regular name of a game that is played using the
>same board and markers as Go, but is much simpler than Go. Unless
>Mindgames is confused (or I am), I don't think this will satisfy
>Kenneth.

Richard may well be correct. GO-MOKU may not be the same as GO. (I wouldn't know.) At any rate, I got a couple of e-mail requests for more info so I decided to put it on the net.

First, I couldn't find an address either on the package or in the documentation. Here is what it did say.

The company is ATARI MINDGAMES (a division of Atari?). There are two copyright notices as follows:
(c) 1988 Atari Corp. (UK) Ltd.
(c) 1988 Bray Research Ltd.

I could not find an address on the package but I'm sure someone on the net can get an address for Atari Corp. (UK).

The package includes two games, GO-MOKU and a similar one called RENJU. It includes brief instructions on how to play the games, including the basic rules of the games. It also includes options for 'book' openings (a particular sequence of opening moves), stepping backward or forward through a games, and even has an advise move option. It has nine difficulty levels. I have not yet managed to defeat the upper levels at all but I cannot claim to be a professional GO-MOKU or RENJU player.

It works find on a 1040 STF with a monochrome monitor but claims to work on any 520, 1040, or MEGA with either monochrome or colour.

I purchased the game for about $10 from a 'bargain shelf' on a computer store in Oshawa, Ont., Canada. I don't know if it is still available or not.

jmw@tasis.eecs.utas.edu.au (John Williams) / 6:42 am Sep 19, 1990 /
> Is Fattrib able to report on directories?

My experience is the same as yours - NO. I use Fsfirst(). It will return the correct attribute for a directory, although it's a bit more work, having to set up a disk transfer buffer first (using Fsetdtc(), I believe).

I'm using TOS 1.? I wonder if it's fixed in 1.4?

>>pointed to by the _FRB cookie.

>Hum, hum, and how do we detect that some RAM is a) VME RAM and b) 16
>bits wide? Did I miss something here?

My comment about VME RAM was not clear. In the TT030, which is the full name of the machine that's now available, there are two kinds of VME address space: A24/D16 and A16/D8. These are not 32 bits wide, so the SCSI chip can't access them. The memory map, telling where in memory those segments appear, should be part of the TT documentation: if it's not, it will be.

The VME expansion isn't really for RAM anyway: VME RAM for a TT is expensive and slow -- slow because it's only 16 bits wide, because it goes through the VME bus, and because it's not cacheable by the 68030. You're far more likely to want to put a video display card there, or extra serial ports or something. For those, the fact that the processor can't get at the memory at full speed won't hurt too much.

2046. v04INF1: Introduction to comp.sources.atari.st

Newsgroup: comp.sys.atari.st
Date: 1990-09-20 19:30:53 UTC
From: koreth@panarthea.ebay.sun.com
Message-ID: <339@grapevine.EBay.Sun.COM>
Source record: 238533
Cross-posted to: comp.sources.atari.st,comp.sys.atari.st

Submitted-by: koreth@panarthea.ebay.sun.com (Steven Grimm)
Posting-number: Volume 4, Info 1
Archive-name: intro

This is the first of two introductory articles about comp.sources.atari.st.
This one describes how to submit source to the newsgroup, where the
archive sites are, and how to contact them. The companion article lists
all previously-published sources.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm
koreth@panarthea.ebay.sun.com

Subject: Submitting source for publication

Items intended for posting or queries and problem notes should be sent to
atari-sources@panarthea.ebay.sun.com. If you are on a UUCP-only site, you
can send them to sun!ebay!panarthea!atari-sources. In Europe, send your
submissions to Jan-Hinrich Fessel, the European submoderator of the group,
at unido!atari-sources (or, if you're a masochist, atari-sources@unido.
informatik.uni-dortmund.de.)

If you want verification of arrival, so say in a cover note, or at the
beginning of your submission, if it is small. I try to verify that a
program works, and if I can't get it to work, I may hold up posting it
for a couple of days. Please note that, except in rare cases, source
without documentation will not be published. The backlog from receipt
to posting varies from one to four weeks depending mostly on the set
of submissions currently in my queue.

I prefer that you submit sources and binaries separately, as it's a
pain to separate them, and such submissions are invariably placed on
the back burner. Sources should be submitted in the same format as
binaries -- uuencoded arc, zoo, or lzh files. Please use Pierre Dumas'
"uue" program if possible, as it can correct some common transmission
errors. Split long submissions up into reasonable (less than 50K)
chunks. "uue" will do this for you, if you use "uue -700 file" to
encode.

Please inform me of any special system requirements, and what development
environment was used, so that I can properly test your submission and
label it when I post it.

Subject: The structure of comp.sources.atari.st articles

Each posting in comp.sources.atari.st is called an "issue"; there are roughly 100 issues to a volume. The division is arbitrary and may vary. There are two types of articles in comp.sources.atari.st: sources and "information postings." They can be distinguished by the subject line:

Subject: v04INF2: Index for Volume 1 and other info

This first word in the title identifies this as the third info posting of volume one. Similarly, the subject line shown below:

Subject: v04i081: godsrc -- Universe simulator

identifies this as the 81st source article in Volume 4. Large sources are broken up into smaller pieces, and have subject lines that look like this:

Subject: v04i088: decbustr -- VMS clone in ST-LOGO, Part03/08

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: MWC, Megamax, 1meg, high

This means that the program compiles with Mark Williams or Megamax C, requires at least one meg of RAM and only runs in high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

Alcyon - Alcyon C (included with Atari developer's kit)
MWC - Mark Williams C
Megamax - Megamax C
Laser - Laser C
Lattice - Lattice C
C - Any C compiler
OSI - OSI Personal Pascal
BASIC - ST BASIC (this is not a joke!)
uuencode - program is uuencoded (uudecode required to unpack)
arc - program is archived (arc required to unpack)
high - high resolution
medium - medium resolution
low - low resolution
1meg - needs 1 meg of RAM

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: david@bdt.UUCP (David Beckmeyer)
Posting-number: Volume 4, Issue 80
Archive-name: micro-rtx

The "Submitted by" is the author of the program. If you have comments about the sources published in comp.sources.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang

path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this source in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

Please try to use this name when requesting that sources be mailed to you. Also, note that the "part number" given in the title, and the archive name given in the auxiliary header need not be identical.

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do try to limit filenames to eight characters whenever possible, though.

Subject: Reporting and tracking bugs and patches to postings

Most of the time, bugs and updates will be posted to comp.sys.atari.st. Sometimes, "official" updates from the author will be posted submitted to comp.sources.atari.st so that they are archived with the sources.

Since there is no easy way to apply source code patches on the ST, changes to a program often result in a whole new version being posted.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the sources I moderate, so don't send your bug reports to me.

Subject: Listing of archive sites in no particular order

1. Site panarthea is running an archive server, which automatically answers mail requests. Send mail to archive-server@panarthea.ebay.sun.com with the word "help" in the message body for more information. Both the sources and binaries groups are archived on panarthea.
2. Unido is the European archive site. It's running an archive server similar to panarthea's; send "help" to unido!archive-server for more information. Unido archives both the sources and binaries groups.

If you know of additional sites which reliably archive comp.sources.atari.st (or comp.binaries.atari.st, for that matter), please tell me so I can add them to the list.

2047. v04INF2: Index of previously-published sources

I don't know what happened when Neil used to be around. Maybe
incidents like that are part of the reason he got canned. Or maybe
he was just giving you a hard time, it doesn't sound like an lawyers
got involved.

At any rate, I recieved a polite message from Alan Pratt asking me to
remove it. No complaints here.

In comp.sys.atari.st you write:

>Get your facts straight before posting. It prevents embarrassment.

Might I suggest the same to you? I knew all you are going to tell, BUT
(see below).

>Look on the back of a SLC. See the SCSI port? Guess what plugs in
>there! Why, SCSI peripherals - imagine that. Disks and tapes and all
>kinds of clever stuff. But *not* servers. They (servers) plug in the
>ethernet connector, also supplied on _all_ Suns; but you don't have
>to have a server if you've got local disk... (the sun I'm posting from
>has 650 megs local and no server).

I'm quite aware that you connect to server machines with Ethernet and not
with a 300 Bd dial-up modem, you know. However, (see below).

>Also: SLC's can be had for less than $3.5k - shop around. Bluntly, no

Where over here in Europe can I get it? I know a few people, including me,
who'd then buy them for X terminals and such.

>CISC box that I know of now can be justified on price/performance
>grounds when compared to (almost) any MIPS / SPARC / 88K / generic
>RISC machine, unless you already have a large body of non-portable
>software. But that particular arguement can also be used to justify
>IBM 3090s and all manner of like overpriced beasties. 68030 boxes
>essentially don't cut it. The TT was born dead, but Jack & co aren't
>going to tell anybody :-)

While it's not the most advanced technology, it certainly wasn't born
dead. However, people are trying to beat it to death now it finally WAS
born at all :-).

>--
>Ross Alexander rwa@cs.athabascau.ca (403) 675 6311 ve6pdq

This is below :-) (See above :-)):
Todays $ exchange rate in Germany: a $ costs 1.63 DM

Now the facts, cool and emotionless: you will not be able to get the Sun SLC for
$3.5K in Germany. It has just been announced by Sun for a market price of
11980,-- DM (which at current exchange rates comes to $7349.69). That's
the price of the basic version which according to IX (a UNIX[TM] magazine
by Verlag Heinz Heise GmbH&Co. KG) comes with a 17" monochrome Monitor with
integrated motherboard carrying a SPARC processor, FPU, audio-chip and
8 MB RAM. All this you know and I know. The SCSI bus and Ethernet connector
are also mentioned.

Anyhow, we're now at 11980,-- DM. To get a 650 MB SCSI drive system you'll have to invest another 9980,--DM ($6122.70) [that would be a CSS GIGAFILE optical disk including a removable medium]. To stay with standard technology, you get a 20MB SCSI drive for 475,--DM ($291.41). However, you probably want at least 80 MB which you have to pay 789,--DM ($484.05) for.

Other prices include
- Micropolis 1588-15 SCSI 760 MB 5198,--DM ($3188.96)
- Micropolis 1578-15 SCSI 327 MB 3398,--DM ($2084.66)
(probably not THE CHEAPEST but one of the cheaper offers).

In other words, to get a SLC and a 80MB drive, you have to spend about DM 12,455.00 ($7,641.10), to get anywhere near a 650 MB drive you spend DM 15,378.00 ($9,434.36) and for the setup with 760MB drive you pay DM 17,178.00 ($10,538.65). I guess you get the picture. The $ prices are just for your interest. You can't truly compare them with US prices because of things like different VAT, customs, transport costs, different legal requirements, ...

Anyhow, before I spend 12,455.00 DM, I'll probably settle for a CISC box. No matter how powerful you want to get, you spend at least 5000.00 DM ($3067.48) less even if you do buy one of these expensive CISCmachines by Commmodore, Atari, Apple (almost as expensive as your Sun), or one of a million PC clones for even less. And you do have or will get a good software base by all sorts of vendors and software houses. How is it with a Sun?

So, next time you go quoting Californian prices to German readers, check where what you're reading came from, OK? OK!

So long,
Martin

Disclaimer: SNI has nothing to do with this. They don't even know I have any opinion.

2050. MiNT

Newsgroup: comp.sys.atari.st
Date: 1990-09-20 21:35:40 UTC
From: ekrimen@csuchico.edu
Message-ID: <1990Sep20.213540.12460@ecst.csuchico.edu>
Source record: 238543

I've been reading about MiNT, and have a question. Is it a multitasking-out-of-the-box deal, or must I know how to program to use it, like Micro-RTX? Thanks for the info!

2051. TT at the WAACE show

Newsgroup: comp.sys.atari.st
Date: 1990-09-20 21:40:59 UTC
From: chuck@umbc5.umbc.edu
Message-ID: <3986@umbc3.UMBC.EDU>
Source record: 238544

I have just heard that Atari plans to show the TT at the WAACE Atarifest in October, but only to registered developers! Is there any truth to this? If it is true, I think it would be a big mistake. Many Atari users have been waiting for a LONG time for this and more delay will just cause more people to abandon ship. I have been looking forward to seeing the TT for many years and am really getting tired of waiting...

Thanks in advance for any replies!

Chuck Rickard

2054. Flakey 1040 drive

Newsgroup: comp.sys.atari.st
Date: 1990-09-20 23:39:06 UTC
From: jamesl@CIE.UOREGON.EDU
Message-ID: <9009202339.AA08214@cie.uoregon.edu>
Source record: 238379

About a month ago I began to notice that my 1040 disk drive was occasionally scrambling files that I save. The files look fine on the directory but when I try to copy them or load them into a term program I get the message "Data on disk A may be damaged". When I read them from the desktop I get garbage intermixed with the files. So far this has only happened with Interlink, but I rarely use my computer for anything else. A friend suggested it could be a virus but I think it's the fact that the disk is about 4 years old and has never been cleaned. I've been puting up with it this long because I can't afford a repair bill, but it looks like I'll have to do something soon. What I'd like to know is:

1. Might cleaning the disk with a head cleaner help?

2. What could be causing this problem?

3. Where could I get a replacement for an internal DS/DD drive CHEAP?

4. Could a virus be doing this? How can I tell?

All replies are appreciated. Thanks for your help.

>>workstation - not much good for the home user without a server, eh.

>Get your facts straight before posting. It prevents embarrassment.

Take it easy, and read more carefully, that helps prevent embarrassment
too. Martin's message talks about prices in Deutsche Marks. I wonder why
that would be...
>Look on the back of a SLC. See the SCSI port? Guess what plugs in
>there! Why, SCSI peripherals - imagine that. Disks and tapes and all
>kinds of clever stuff.

12000 marks for a diskless CPU is still a lot of money, regardless of
the fact that you can shell out your own additional cash to get an add-on
drive.

>Also: SLC's can be had for less than $3.5k - shop around. Bluntly, no

I bet it's harder to shop around for Sun hardware in Germany than it
is in North America. Think about it sometime. Your quote of "$3.5k" is
meaningless in the context of the original posting.

>CISC box that I know of now can be justified on price/performance
>grounds when compared to (almost) any MIPS / SPARC / 88K / generic
>RISC machine, unless you already have a large body of non-portable

>essentially don't cut it. The TT was born dead, but Jack & co aren't
>going to tell anybody :-)

Yep, once again, too little too late. But that's OK, no one else will
have 68040 systems available till next year anyway. If the other
hardware is fast enough, it may be cute to drop an 040 into a TT.

Meanwhile... the '040 specs put it well ahead of the current generation
of RISC chips, (barring, maybe, the IBM RIOS system...) so I don't think
you can discount CISC so easily. Not at this time, at least. And when
you can take advantage of direct binary compatibility, that's always
the easiest route, eh? Then issues of porting to new hardware don't
have to raise their ugly heads...

(Note that this little nicety doesn't really apply to IBM mainframes.
With their site-customizable microcode, you can't guarantee binary
compatibility from one identical model CPU to the next, let alone

across the product line. But we already knew IBM mainframes were
anachronisms, so no biggie...)

>
> Steve, I do monthly disk for the users in Australia and New Zealand.
> I have the months worth of Z*Net and STreport on it. If you would
> like a copy each month drop me a note. As a parting note Zmag is
> now called Z*Net.

Almost true, but not quite. To straighten the record out a little,
A*Net Online is the name of the ST magazine. Zmag was (and is again)
the name that Ron Kovacs applies to the 8bit version of it. After
a nine months absence, Zmag has reappeared on a bi-weekly basis
with news that is aimed primarily at the 8bit Atari user. It is
even numbered #184, so no numbers were skipped. The next issue was
supposed to be out Tuesday, but it isn't up on Ron's BBS yet. (as of
a little eariler this morning). According to mail he left me, that is
because he was at the Atarifest in Glendale, CA. I'm looking forward
to his report.

Incidently, Jon, thanks for your fine articles in Z*Net. I like to
hear the news about Atari in other parts of the world.

I had this same problem with my original FALCON and the backup of disk #2.
After many attempts, I finally realized that the write protect tabs have to
be in a certain configuration for the disks to work. I can't remember how
they are, but if you look at the working originals and make your copies the
same, I'm pretty sure it'll work.

In article <GOW.90Sep20165414@sakari.mrceg> gow@sakari.mrceg (Ed Gow) writes:
>Can anyone give me information about the STacy features and price plus

I JUST got a Stacy. If it didn't win some design awards it should have. It is the best looking and solidest feeling laptop I've come across. The one I have is 1M of RAM and a 20M hard disk (furnished formatted and partitioned 4-6-10). The ports are all covered, but most of the frequently used ones are under the back swing-down cover rather than slide-offs (this is good). The screen is magnificent blue and white; by FAR the best LCD screen I've seen, and readable from a huge range of angles. The trackball is very good for moving the mouse, but the button response is very different from on the ST (I'm tempted to say it's bad, but in a week maybe I'll get used to it). The main keyboard is very good; the numeric pad is small, but there and usable. I prefer the way the function, arrow, etc. keys are on the Stacy to the way they are on the ST. The disk is apparently quick. Something makes enough noise to be annoying in a quiet room. Autoboot on initial power-up is about a 50% proposition; reset fixes that. Keyboard warm and 'cold' boot are supported (I have some indication that some status is preserved across a keyboard cold boot), as well as the usual reset button warm boot.
There are EXACTLY the same ports as on a regular ST, including mouse, joystick and monitor.
A couple criticisms: the power connector socket should be accessible on a completely closed case, rather than being behind the back swing-down. Some of the slide-off panels are too hard to open (that's a tough one: on many machines they fall off too easily). Even though the machine simply doesn't run on batteries, I wish there had been some provision for saving its state across a loss of power, at least for a few minutes.
I like it. If you separated the screen from the system box, put the screen on a pantograph arm (and made it a LITTLE brighter), and put the system box in a drawer, you'd have a KILLER executive machine.
After all this, I just don't know about prices. I'd guess around $2000, maybe a little less.
Steve J.

2063. Re: Desk Jet 500

Newsgroup: comp.sys.atari.st
Date: 1990-09-21 14:59:30 UTC
From: jeroen@pluto.phil.ruu.nl
Message-ID: <745@accucx.cc.ruu.nl>
Source record: 238395

The DeskJet PLUS has a problem when connected to the ST:
if you switch it on after ST powerup, the ST's hardware gets confused.
It tells you the printer is not available.
As long as the printer is connected but not switched ON
the ST thinks it is there and ready to print.

For the first problem I've written an ACC that resets the appropriate
ST hardware if it finds the printer unavailable; it also serves
as a configuration program for the printer (orientation, line spacing,
pitch, quality, margins).

I'll post it to the binaries soon, along with a NEAT screen dumper
for the DeskJet/+/500 (centered screen dumps, XBRA installation,
compressed graphics data transfer, about 750 bytes).

The second problem I cannot solve the software way.

There may be a hardware modification that solves the problem, if
so I would like to know.

Be aware that it will take many months to create the group; it's not just a simple matter of issuing a command. After the mudslinging fest involved with the comp.sys.atari.st.tech vote, I think anyone who would volunteer to be the vote taker is certifiably insane.

But, if someone _really_ wants to try, that individual should be SURE to read the "How to Create a Newsgroup" document which is periodically posted to news.announce.newusers. (Is that where it goes? Someone correct me if I'm mistaken about that.)

I'm not sure there's really enough game-oriented discussion here to warrant a new group. Remember that you'll need to get a 2/3 majority and at least 100 more "YES" votes than " NO" (oops, I mean "NO" :}) votes for the group to be created.

2066. Neocept new address

Newsgroup: comp.sys.atari.st
Date: 1990-09-21 15:22:24 UTC
From: pegram@uvm-gen.UUCP
Message-ID: <1660@uvm-gen.UUCP>
Source record: 238394

I just got my Word Up disk 1 update, and Version 2.0 of Fontz from
Neocept yesterday. For those who are wondering, the reason it took so
long is because Fontz 2.0 was only finished on September 11th. The
upgrade to Word Up 3.0 is the August 20 version, and now requires that
you also upgrade disk 5 (the printer drivers).

Send in your Word Up 3.0 disk 5 and a Self Addressed Stamped Envelope ($0.25)
(in the U.S.A.) to Neocept at its new address:

Neocept, Inc.
925 Paseo Camarillo, Suite 646
Camarillo, CA 93010

tel. (805) 484-2041

Neocept is still selling off ST hardware:

Atari Laser printer: $490.00
1040STF w/mono monitor, $360.00

call *them* about the hardware.

I'm not affiliated with them, just a fairly satisfied user
(hate the blinking line cursor though! 8-).

If you want a MAC Write (tm) like wordprocessor in native ST mode,
Word Up 3.0 is it. It has an excellent dictionary and thesaurus, and
is in its way, a rival for Word Perfect and low end desktop publishing
programs. It has multiple fonts and the ability to incorporate bitmap
and object oriented pictures in your documents. It runs on unexpanded
520s and can be used off of floppies, but more memory and a hard disk
are recommended IMHO. It really is getting to be excellent and still
cheap with this 3.0 version.

If this sounds good to you, buy it, so Neocept can be around for the
coming TT age 8-).

> DeskJet series printers for years (no exaggeration!) with no problems
> whatsoever. The 1040ST and the HP DeskJet/DJPlus/DJ500 are a perfect match.
> Enjoy.

Funny, there was a big stink about it. Some (*other* 8-)) HP person
claimed that the ST's parallel port was joke after some people's
soundchips burned up, trying to drive the deskjet too quickly
(graphics?), over, perhaps, too much cable. The solution was reported
to be the addition of heavy duty TTL line drivers inside the ST end of
a parallel cable. Don't blame me, I just remember this, and don't
have a deskjet yet - looks *much* better to me now though! Anybody
know what a used dj or dj+ is going for these days?

[all bitching about difference in German and US pricing deleted]

Listen, it is obvious that for whatever reason the computer companies have decided (or were forced due to regulations) to price their systems differently in Europe and the US. Until that changes, Atari will have a nice thriving market in the European marketplace. Great, that is fine. However, here in the US the manufacturers are more competetive in price and those companies that boast about "power without the price" but who do not deliver will lose (or never find) any market share. Maybe someday, the United States of Europe will adopt more fair trade practices and dispense with all the VAT and regulatory bullsh*t so that you fellows can buy a computer a the same reasonable cost that we can.

Cheers,

Chris

2072. Mac Emulator Survey

Newsgroup: comp.sys.atari.st
Date: 1990-09-21 20:39:13 UTC
From: paul@tredysvr.Tredydev.Unisys.COM
Message-ID: <924@tredysvr.Tredydev.Unisys.COM>
Source record: 238378

I notice a lot of interest in the Spectre emulator. I am trying to gather enough information to write an article about Macintosh emulation. The questions posted are a bit long, but I think they pretty much cover everything. All constructive data are welcome, yes, even Petre's, but note the emphasize on CONSTRUCTIVE data. Answer as many as you stand, but please e-mail all response. The result will be posted on this group. Thanks!

1. SYSTEM SOFTWARE: Compatibility with Macintosh System Software up to what version? Can you run Multifinder? How stable is it? Is there mention of System 7 compatibility?
2. FLOPPY SUPPORT: Can it read Macintosh Diskette? What format can it read 400K, 800K, 1.44 MEG? Is a Macintosh disk drive needed? How is disk ejection and swapping handled. What is the performance compared to an SE?
3. HARD DRIVE SUPPORT: What hard drives are supported? Can host computer share data on the same partition or is seperate partition needed? Is removable media supported? What is the performance of hard disk transfer compared to a Macintosh SE?
4. VIDEO SUPPORT: Do you get a larger screen? Is screen redraw faster compare to an SE? Is the picture correct in proportion (a circle looks round instead of oval)?
5. SOUND SUPPORT: Is sounded supported? If so, is it clear or distorted?
6. PRINTER SUPPORT: Has anyone try to print to an imagewriter directly? Is third party printer driver needed? Has anyone try printing postscripts?
7. OTHER PERPHERIAL SUPPORT: Has anyone try using a modem under Mac emulation? Can it access any of the host computer's devices such as MIDI ports? Can the Mac emulator use the built in system clock? Can it emulate Appletalk?
8. ACCELERATORS: Has anyone try to run it under an accelerator? Is there any side effects?
9. SOFTWARE COMPATIBILITY: Has anyone encountered incompatibility with software except for games? with DAs? with Inits? with utilities in general? with HyperCard? What about programming language and debugger?
10. RAM OVERHEAD - How much RAM do you lose under emulation for overhead? What is the max RAM configuration supported?
11. HARDWARE REQUIREMENTS: What do you need (mac disk drives, mac roms, etc), and how much is it going to cost? What system is needed to run the emulation? Name any hidden cost.
12. EASE OF INSTALLATION: How easy is it to install? How was the customer service (in fixing existing problems)?
13. Anything else you can think of.

The limitation seems to be free memory seen in Mac mode rather than actual ST memory: I wrote stacks using System 5.3/Finder 4.1[<-?] with a 1-Meg 520 and had no problem. Maybe you need to cut down on Mac accessories and fonts, too, but I recall my system was pretty loaded and still worked fine.(I have more memory now and use System 6.0.2.)

[stuff about unfair trade deleted]

The _point_, Chris, is that the TT prices we have are given in DM.
You insist on comapring the TT's German price to the Sun's U.S.
price. We don't yet know what the TT's US price will be. Until then,
There's no point in complaining about how the TT's German price doesn't
stack up to a Sun's U.S. price. As you yourself pointed out, U.S.
machines cost more in Germany.

`Cheers,
`
`Chris

2080. Amiga owner's thoughts on ``PETRA''

Newsgroup: comp.sys.atari.st
Date: 1990-09-22 04:13:12 UTC
From: lshaw@walt.cc.utexas.edu
Message-ID: <37485@ut-emx.uucp>
Source record: 238391

It has come to my attention that a certain person who calls himself "PETRA"
has been posting mean and nasty things to this newsgroup. This steams me
for two reasons:

(1) I don't want y'all (yes, I'm from Texas) to think that Amiga people
are jerks. Really, we're not. :-) (Though some of us may be geeks,
but that's an entirely different story, and probably true of people
all across the net :-) :-)).
Personally, I like my Amiga more than I like Atari ST's, but that's
why I bought it in the first place. I'm sure all of you have good
reasons for owning an ST.

(2) There's a musical group called "Petra" that I happen to like very
much and it annoys me that someone would steal their name and then
have the nerve to act stupid.

Stolen quotes:
"My apple is better than your orange"
"My cray is better than your sparcstation"

Just trying to extinguish the flames...
==
"The beauty queen, clevely clad, Logan Shaw

-Elim Hall, _Things_Break_

2081. Another Amiga owner extends hand...

Newsgroup: comp.sys.atari.st
Date: 1990-09-22 04:56:43 UTC
From: greg@walt.cc.utexas.edu
Message-ID: <37486@ut-emx.uucp>
Source record: 238392

I wanted to add a few things to what Logan Shaw (lshaw@ccwf.cc.utexas.edu) said....

What "Petra" did was immature and inexcusable. I am ashamed that this child (I'm making assumptions from his/her actions) said what he/she did, and I want you all to know that his/hers is not the general opinion of the comp.sys.amiga newsgroups.

Also, being an almost religious reader of comp.sys.amiga, I can say that I have never seen this person post. Apparently he/she wasn't very knowledgeable about the Amiga...

Amiga owners in general, as with all computer owners, are pretty proud of their machines. This sometimes results in flame wars, unfortunately. Most of this is directed toward Macs and IBMs, and is usually pretty legitimate stuff, too.

Recently comp.sys.amiga even had an Atari TT thread, although I must admit to not reading it....

As Logan said, we have a few things in common. One is that we are the owners of the only _affordable_ 68000 machines. (More bang for the buck!) We both have exciting new machines.

I understand (from reading the Petra-related posts here) that Atari is having managment troubles. Commodore has had theirs, too. Only in the last year or so have we had any progress from CBM. We're all really excited that CBM is getting their act together. (As one poster used to say, "Commodore's marketing sucks dead gophers through a garden hose.") I wish you Atari owners the luck we've had lately with Commodore!

In the next few years we will most likely be seeing the decline of the MSDOS market. The new (very powerful) Macs are outrageously priced. The time where no one computer dominates will be soon coming.

Now, while I'm here, I'd like to request info on the full line of Atari 16-bit (and 32-bit ??) machines. This is for my own education, however I am willing to provide the same to those who request it. (Doing this publicly might start another flame war.) Please include stats on processor types, speed, memory (stock and max expandability), etc. List and educational prices would also be appreciated. And one last thing I would like is info on where Ataris are being used in the business/educational world.

Thanks for reading my comments. I hope I have presented a more worthy image of Amiga owners to you. This "Petra" is certainly not the norm...

2082. MiNT

Newsgroup: comp.sys.atari.st
Date: 1990-09-22 04:59:11 UTC
From: entropy@rice-chex.ai.mit.edu
Message-ID: <10913@life.ai.mit.edu>
Source record: 238393

I downloaded MiNT and so far it looks nice. Problem is, it doesn't do me all that much good since I can't stop any jobs--i.e., almost all the programs I use regularly (JOVE, uniterm, less) use 'raw' input mode, so they eat the ^z themselves. Suggestion to the author, Eric Smith: put in another special ctrl-alt keystroke like ctrl-alt-z, to stop the current job whether it takes raw or cooked input. This would be nice for the other keystrokes ctrl-c and ctrl-\, as well. I make this suggestion based on my observation that the ctrl-alt keys for debugging _do_ work in raw mode. There are probably technical problems with this that I can't possibly forsee since I have only a miniscule understanding of multitasking, but I do know that it would make your program much more valuable. Meantime, I'll use it when I need pipes and such but it would be nice to be able to use a program with so much potential to the fullest extent of its abilities.
Good luck,

nick

p.s. If I'm just overlooking something and there is already a way to do what I want, _please_ let me know!

> use it, like Micro-RTX? Thanks for the info!

MiNT comes with some simple utilities to run programs in the background,
run two programs connected by a pipe, etc. (i.e. it's not just the
kernel, like RTX). It also comes with a (very simple!) shell with
job control and pipes. I hope people will write better stuff for it,
but in the meantime it is usable.

MiNT is not in the public domain, but it is free (like gulam). I must agree
that it would be nice if someone wrote a nice shell for MiNT (or at least
improved the sample shell that comes with it). The GNU "bash" shell should
port to MiNT relatively easily; anyone want to take a crack at it?

>
Just about any multitasking system will allow this (e.g. MicroRTX or MiNT).
Minix will too, and in fact is probably the best choice for it (since it
has a login procedure and security built in). However, minix does not run
TOS programs, only minix ones. (I presume OS/9 would be in a similar
situation).

Add one more vote for the atari.st.games. Quite often I seek hints
to solutions of games and it would be nice to post questions on the net
without forcing readers of atari.st to sift through it all.

2087. HELP! Calamus vs. TOS version!

Newsgroup: comp.sys.atari.st
Date: 1990-09-22 15:25:55 UTC
From: Ryszard.Nipl@mop.luth.se
Message-ID: <1509@hagbard.dc.luth.se>
Source record: 238455

Hi Netters,

I have purchased the Calamus (version 1.09) from USA (thank you,
Steve, for your tips!).

Immediately after coming back from the post office and having
the parcel unpacked I put on and tried to set it up and ....
all my expectations have "gone with the wind". I got the following
diagnostics on the Calamus logo:

"CALAMUS doesn't work on this TOS version"

and very strange "R3/2" in the upper left corner of the screen just
on the Atari logo.

My computer is one of the oldest Mega4 I know with its number A1 7
(yes 1987!) and 4 (many zeroes) 232 on the very end. So I suppose it
must be TOS 1.0 what I have (or may be 1.1 as under start procedure
the GDOS resident version 1.1 comes).

My questions are:

1. which version of TOS should I buy to satisfy Calamus needs?

2. which version should I choose: 1.4 (or its Mega matched version
1.5, is it?) or may be 1.6?

3. how can I purchase the TOS chip from the USA? Do you have some
good addresses with nice prices? Which is generally price level
for TOS chips?

4. how about Calamus under Minix? Has anyone of you any experiences?

Thank you in advance
Ryszard

PS: Extra questions (rhetoric ones, I don't wait any answer!):

1. why it is nothing said about TOS version needed in the Calamus
descriptions, offerts, advertisments, even handbooks and manuals?
(Never I meet it!)

2. why contents of SYS folder described in the handbook is (in about
2/3 of the list) different from the real SYS folder contents as
delivered?
There are files: CALAMUS with extensions: ALT, CEF, CHT, HLP, RSC
ENGLISH " " : CHP, CWB
LAN_ID without extension.
May it function?

I am impatiently awaiting. Thanks
Ryszard

Look petra, no on really gives two craps what you say. The majority of
the people here enjoy using the atari, and you are not going to change that
we don't care for your remarks. I must tell you that reading your message
reminded me of the olden days of 300 baud, phreaking and rampant wars over
the commodore 64 and the atari 8bit. Your drive is simply your either,
loathing for atari,or your love for commodore. Well, some of us feel the
same way about you and your commodore, but we are mature enough to suppress
these infantile feelings and smart enough not to waste network bandwidth
with it. Again, this group is for people interested in the st to discuss
the uses of the machine, I do not beleive you are a part of this. Please
go away....

jcohen@islsun1.mse.lehigh.edu
(if you care to flame, mail me here ,the rest of the net is far less
interested in what you have to say than I am. (I dont care either)

>Mac portable???

YES!!! Good enough to make Apple/Mac users nervous, since it even does something the Apple Portable can't do: run MIDI software (ST's SW, for Mac MIDI SW Dave Small created another board that allows it). Dave Small (creator of Spectre) is giving a lot of support to the Stacy, he's designed (though I'm not sure if marketed yet) an INTERNAL Spectre GCR for it, and some other nifty goodies... 'nuff said.

2097. Mercury UUCP posted without me knowing anything about

Newsgroup: comp.sys.atari.st
Date: 1990-09-22 22:30:16 UTC
From: rodney@merkur.gtc.de
Message-ID: <6452703@merkur.gtc.de>
Source record: 238469
Cross-posted to: comp.sys.atari.st,dnet.atari,sub.sys.st,mercury.allgemein

Stuttgart (FRG), September 22. 1990

S T A T E M E N T

Some days ago my Software, called "Mercury UUCP modules" or "Rodney's UUCP modules" was posted to comp.binaries.atari.st by an aquaintance of mine; ripley@opal.cs.tu-berlin.de - Hans Ch. Eckert (Berlin, Germany).

Mr. Eckert has posted my software WITHOUT MY KNOWLEDGE. Some days ago he asked me to write an english documentation for Mercury UUCP without telling me, what he was about to do. I sent mail to him, saying that I would send a copy of Mercury UUCP with an english documentation to Adrian Ashley (Edmonton, Canada) so he could post it to comp.binaries.atari.st.

IN SPITE OF THIS Mr. Eckert has posted an old and buggy version of my software, without asking me if I would agree or not; even without telling me at all. -

I cannot imagine what this guy was thinking of, when he did this. I want to observe that Mercury UUCP is NOT FREEWARE but Shareware; Mr. Eckert has posted it WITHOUT MY PERMISSION.

So: Sorry, if there should still be severe errors in the stuff. Don't blame me, but nevertheless feel free to ring me up if there should be problems.

A complete distribution of "Rodney's UUCP modules Version 1.16" is available via Ano. FTP at the following host:

rusmv1.rus.uni-stuttgart.de (129.69.1.12)

I suggest you use version 1.16, or alternatively wait for the next posting. I shall post binaries and the source of the stuff at X-mas.

>memory those segments appear, should be part of the TT documentation:
>if it's not, it will be.

The thing that has interested me most about the TT is that it is probably going to be the cheapest VME machine around. My company develops disk arrays that operate over the VME interface (among others). We currently find it difficult to give each software developer their own VME host and disk array. A cheap VME machine like the TT might change all that (once a UNIX port is available, anyway).

Could you give me some more specifics about the VME on the TT? Is it a 6U card cage? How many slots are available? How much power is available? Are A24/D16 and A16/D8 the only supported modes? (A16/D16 would be nice.) Is host memory accessible by VME bus masters?

Well well well,....I think Mr Davidsons best quote of the century must be :-

"Wish I Had Bought An Amiga"

when he found his Hard Drive had trashed for the million time. Despite being against multi-tasking, he was still interested in getting someones multi-tasking kernel and as for hi-res displays, at least Amiga owners dont have to pull plugs out of their computers every 2 secs for the second monitor they would have to buy!! And as for Copper processing, well a DMA channel devoted to a graphics co-processor must be better than not having one.....so I presume that must simply boil down to jealousy. And as for playing populous and running ray-tracing....well most games take complete control of the computer for many reasons (not just for software protection) and many professional packages such as pro-write, Excellence! and everything that runs from Amiga dos can multi-task with other tasks.

Mark also likes Soundtracker, so much so he is searching every PD software library in the land for it. His first introduction to this program was on the Amiga....my Amiga (btw we live in the same flat!). He's also quite excited about DPaint on the ST and has been ordering many Amiga animations which have been converted (Walker Demo, The Chase etc).

Another interesting point, we play Kick Off 2 quite a bit in our flat. We have both Amiga and ST versions of the game......and when I play Mark..... 95% of the time it is played on my Amiga......and not the ST. Why? Because the ST version runs in super-flicker head-ache mode!!!!!

I believe in critical argument, after all freedom of speech is fundamental to our very existence. But I would prefer to have a qualified argument, and not some bandwidth wasting drivel. Secondly, I was under the impression this was comp.sys.atari.st which is meant to be about ST hardware/software/news/tips etc. From this, I find it very hard to comprehend why the Amiga is a discussion point. And as for this rogue Amiga person who has been sending unqualified messages, you have my sympathy for his abuse of netiquette.

I have posted this message after my flatmate had a good chuckle about what he had posted to the net (he refused to tell me himself). The message, when I read it was nothing short of childish ignorance and I apologise to the net on his behalf.

Dear oh dear, Gallup reported that the Amiga now had 28% of the UK Home Computer market which was a good increase on the year before. The ST had dropped to only 16% of the computer market. I guess if Commodore are in great trouble, Atari must be in real sh*t.

I report only the facts

I ported it a year ago and sent it off to comp.{binaries,sources}.atari.st
If you look in the archive I'm sure you'll find GNUGO some where. The port
was trival since there are no fancy graphics.

2104. ICD tape streamers

Newsgroup: comp.sys.atari.st
Date: 1990-09-23 14:15:05 UTC
From: q1cbw@turing.newcastle.ac.uk
Message-ID: <1990Sep23.141505.3120@newcastle.ac.uk>
Source record: 238474
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a hard disk system that uses an ICD advantage plus host board and would like to add a tape streamer to the system. The first problem is, that I would require streamer software etc. ICD produce some software but I do not know how good this is, how I could obtain it, or how much it costs. The second problem is, what tape steamers does this or any other software recognise? (A SCSI device would be prefered.) If not a SCSI device what type of device is it (so I can arrange a suitable SCSI->XXXX board.)

I know about the existance of removerable hard disk systems but in our experiance these are not as reliable and have a much higher media cost.

Any help is welcome.

Many Thanks,

Dave Halliday

>in a small shoebox-style case. The Toadfile has room and cables for one more
>device (but maybe only 3.5", I cannot remember).

The SyQuest Mech is a standard 1/2 height 5 1/4" drive.
The TOADFILE has space to accomodate TWO of these 5 1/4" drives.

NOTE: CARTER GRAPHICS's drive also uses ICD ADV+ host, and
is also nice. They make several models... including
an under monitor style (like TOAD) and also a SUPER
small drive (just a bit bigger than a floppy drive.
The front panel is about the same, but it is deeper.)

>Since it is an embedded SCSI device, whipping one up yourself should be cake.
>Just get a baby AT case with power supply, and ICD host adaptor, and a
>Syquest. You can get a Computer Shopper and hunt down a
>Syquest mech (I was quoted a price of $519 about a >month ago). Bolt all
>the stuff together, and voila.

NOTE: THE $519 SyQuest comes WITHOUT A CARTRIDGE!!!!!
----- A cartridge is an additiona $79 plus shipping...
The ICD ADV + is (I believe) around $100.
A HD Case and Power Supply is at least $80.
A fan is cheap, about $10.

CONCLUSION: After adding up all of these prices, and NOT INCLUDING
---------- Shipping charges, which may be substantial, we arrive
at the figure $788.00. Seems like a lot of TROUBLE
When one considers that the TOADFILE is about $850.00,
and includes the larger UNDER MONITOR case which has
a special power supply to supply TWO (2) drives, and
has a case to handle 2 drives as well.

I'm not affiliated with any of the above companies, and the
opinions expressed are my own. I do own the TOADFILE, and a friend of
mine owns the CARTER GRAPHICS drive. We are both very happy and
consider our drives to be entirely equal. The only deciding factors in
purchase should be case style preferences and locality to MD or Utah

(where Toad and Carter are loacated respectively).

I would also agree with the previous poster that the ICD ADVANTAGE PLUS host is far superior to any other, ceartanly better than the ATARI. I've read on usenet that people are having troubles with the ATARI when it comes to Swapping disks "on-the-fly" where the disks have different partition sizes... THERE IS ABSOLUTELY NO PROBLEM WHATSOEVER in this type of process using ICD's ADVANTAGE... I consider this a HUGE ADVANTAGE.... PLUS, the ICD ADV+ comes with a battery backed clock that is a great Plus!

About using SyQuest disks on other SyQuest drives. I have 2 froends with SyQuests (one Carter, one Toad). Between us we have 7 cartridges. All of these carts. are COMPLETELY compatible in any of our three drives!!! (of course if you had the ATARI host, you'd not be able to swap on-the-fly with these carts... because they are all partitioned differently.... including SPECTRE partitions.)

Hope this helps,
Jim Tauberg

I just found a nifty mono-only go that looks very nice. I am not a go player, but one of the features is the ability to load historically significant games to look at them (there are several included with the program). This would lead me to believe that this is a "real" go (not a subset of). I would not mind posting it to comp.binaries.atari.st, except I do not know how. Could someone email me the instruction posting?

From: swood@vela.acs.oakland.edu
Message-ID: <3106@vela.acs.oakland.edu>
Source record: 238480

Has anyone by chance downloaded a version of Phone.acc off of the
'Atari Explorer' files off of Genie or Compuserve???

I read the explorer article on the program recently, and I am interested in
getting a copy to see how it works. I just got on-line at compuserve and the
program is no longer in the explorer files. Anyone have it?

Also, I would like to know if anyone has seen or used the new 1.4 version
of cardfile? I have the 1.3 version via shareware, but have been reluctant
to send my 20 dollars, as the lack of wildcards in the filters makes it
incomplete to fill my needs. Does the newer version use wildcards?

swood

2111. IBM joysticks on an ST?

Newsgroup: comp.sys.atari.st
Date: 1990-09-23 19:11:38 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <3107@vela.acs.oakland.edu>
Source record: 238476

I hope that this subject has not been brought up numerous times before, but is there any way to effectively use an IBM style joystick up to an ST?

I noted with the recent purchase of a flight simulator, that the old atari 'switch' style joystick is not sufficient to effectively simulate a flight stick. I have noted that many of the newer flight simulators are allowing for a mouse link-up, and this type of data check might permit for the use of a variable position stick like those used on the IBM's.

Any hints?

swood

E N O U G H !

I've been gone for three days, and on my return I find that
there is STILL a #%#@! Amiga/ST flame war going on! AARRGGH!

Look.

Let me state some simple requests.

1. If you have an Amiga, great! It's a neat machine and there's a lot
of better things you can do with it than write letters telling ST users
how terrible their machine/company/etc. are. To find out some of these
better things to do, read comp.sys.amiga or any other amiga group. You'll
find people who would love to talk to you about your machine! Plus, us
ST users might be able to get back to some worthwhile discussions!

2. If you've got an ST, please please PLEASE do not reply to any of the
current 'your ST sucks' messages with 'Oh yeah?! well let me tell you'
type messages. This only encourages this @#$%! war to continue, and we've
got better things to talk about. Thanks.

Apologies for this flame, but I've been putting up with this obnoxiousness
since PETRA, (may he never find access again) started it all.

Thank you,
Brian Daniels
(just a happy ST user who would like to read about the ST, not the Amiga)

2114. Re: Purchase decision, to STe or not?

Newsgroup: comp.sys.atari.st
Date: 1990-09-24 05:45:55 UTC
From: ekrimen@csuchico.edu
Message-ID: <1990Sep24.054555.624@ecst.csuchico.edu>
Source record: 238485

- 1. Is there software to take advantage of the new modes

A paint program named Canvas is supposed to be able to use the 4096 colors. The utilities for JRI's 4096-color board work on the STe, but they aren't that good and only convert 32 color IFF pics to 32 shade grayscale pics. (I think that's right, but not sure.)

As for sound, there are only PD stuff available that use the stereo sound. There are some great demos and a couple utilities, but that's about it. I've heard that MicroDeal, makers of ST Replay, have a stereo version in the works.

- 2. What sort of good (ie real time, 640x400x4)4 or 5 or 6)
- animation/painting software is there for the STe

There's no such thing as 640x400x4 on any of the ST models. It's monochrome. There's a company called Lexicor, which is some of the authors that wrote the Cyber series for Antic, and they are coming out with some great animation and drawing stuff.

- 3. If I want to run DTP stuff, do I need the monochrome monito{ ?

Calamus requires a monochome monitor. Pagestream does not.

- BTW does STe have high res color, or is it the same as the ST,
- 640x200is the highest color resolution?

Yes. It's the same as the other ST's, only 4096 colors to choose from instead of 512.

- Does the STe do full real overscan?

No, don't think so.

2115. floppy disc problems

Message-ID: <893@idcapd.idca.tds.philips.nl>
Source record: 238489

As far as I know, Atari Benelux is shipping TOS1.4 for some time now.

Floppy disk drives stopping SUDDENLY with reading is not very likely caused by dirty drive heads I'm afraid. Dirty heads usually tend to produce a lot of soft errors (and therefore retries). This becomes worse when heads are becoming dirtier. I think that something about the diskcontroller logic is ill. Maybe you can try to connect an external drive and test if this drive works allright? If so, your drive is dead.

Good luck

From: paulr@syma.sussex.ac.uk
Message-ID: <3505@syma.sussex.ac.uk>
Source record: 238496
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've been trying to get a simple program working on an Atari ST using FastBASIC. The idea is to connect a heart rate monitor to a suitable input (parallel port status line or serial port handshake input) and use a VBI interrupt routine to count heart beats. Unfortunately I get a crash as soon as I install the VBI interrupt routine, so I guess I must be doing something wrong. Since I don't normally program Atari ST's and I have no debugging tools and very little information at my disposal I was wondering if anyone could cast their eye over the following short test program and see if they can spot where I'm going wrong. The program halts with a bus error at the CALL to "init".

Thanks in advance,

//Paul

HP DeskJet Plus / Atari ST power-up sequence problem -- solved!

I have discovered that if the Atari ST parallel (printer) port
STROBE line (normally high) is pulled toward ground (low) by a
heavy load (such as a powered-off HP DeskJet Plus), the ST STROBE
line will thereafter stay low until the load is removed (by
powering up the DJ+), and until software intentionally sets the
STROBE line high again. (Weird note: the STROBE line has to be
pulled low for something on the order of 1/2 second or longer for
it to "stick" low -- I do not know why this is.)

Once the STROBE line gets stuck low, the DJ+ responds with a BUSY
set high. The Atari TOS will not send any data to the printer
while the BUSY line is high -- so no printing can take place.

There are six solutions to this grid-lock (I recommend #6):

1.) Power up the DJ+ first and the ST second. (Then the ST will
never see a heavy "low" load on the STROBE line.)

2.) Push the Atari RESET button. (The reset sequence sets the
STROBE line high, clearing the problem.)

3.) Have a software routine which sets the STROBE line high. (No
sense putting this in the auto folder to clear it on reboot,
since reboot itself clears the problem -- until next time.)

4.) Power cycle the DJ+ with a print job in the ST "queue". (You
will lose the first part of the print job, and I think the
print job must be a minimum length of bytes long to get it
over the DJ+ power-up self-test delay.)

5.) Momentarily ground the BUSY line with a print job in the ST "queue". (I'm not sure if you will lose the first byte of your listing with this method.)

6.) Install a PNP transistor in the STROBE line. This fix is much simpler than it may seem. Also it simultaneously solves the heavy loading problem the DJ+ puts on the Atari STROBE line. (Without the transistor, the loading on the STROBE line appears to push it near the 0.8 volt level limit. The DATA lines do not seem to have same problem, their low levels seem to be well within limits -- so no buffering seems needed.)

You need:

- One 2N2907 (or practically any PNP transistor)

- Access to the Printer cable wires for pin #1 (STROBE) and any ground pin (pins 18-25 on the Atari end, or pins 19-30 on the DJ+ end.) I managed to do this inside the cover of the Centronics-type connector.

Step #1 Disconnect the STROBE wire from pin #1.

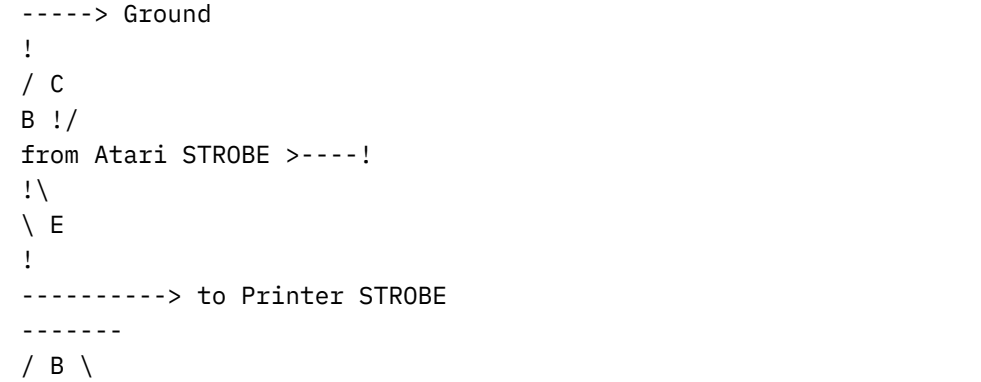
Step #2 Connect the Emitter (E) wire of the transistor to the Printer side of the wire/pin#1 split you did in step #1. (It depends upon which end of the cable you put your transistor into.)

Step #3 Connect the Base (B) of the transistor to the Atari side of the wire/pin#1 split you did in step #1.

Step #4 Connect the Collector (C) of the transistor to one of the ground pins (18-25 Atari end, or 19-30 DJ+ end.)
[Caution: Metal cased transistors often have the case electrically connected to the Collector -- hence the case will most likely be grounded -- avoid having the case touch anything that should not be grounded.]

Step #5 Close up and/or wrap up. Make sure the transistor case and connections are not touching anything they shouldn't be touching.

Figures:



```
/ E \ Metal Can style transistor -- common pin
== ! configuration -- bottom view.
\ C /
\ /
-------

----
! C \
! B ! Plastic Flat sided style transistor -- common
! E / pin configuration -- bottom view.
----
```

Appendix:

Speed on the parallel printer port.

The Atari does screen dumps at about 1250 bytes/second.

The Atari does text dumps at about 714 bytes/second.

A GFA Basic program I wrote dumps graphic bytes to the DJ+ at
about 2174 bytes/second. Since an 8 by 8 inch graphic picture
with 300dpi density requires 720,000 bytes -- you can see that the
dump alone should take almost 6 minutes for even the GFA program.

This all suggests that one might want to take advantage of the
DJ+'s mixed mode graphic commands, where "blank" space is jumped
over. Software should be able to "count" over these locations
much faster than it would take to dump them in dumb mode.

THE END.

Someone wrote to me about my DeskJet Plus single transistor fix to the
power-up-sequence problem and STROBE line drive buffering.

They were still concerned that the data bits need buffering -- I hope
to show with my measurements that there is nothing to worry about.
The data lines do not need to be buffered.

I measured the resistance of the DJ+ data pins. This was done by
connecting a potentiometer between a data pin and ground. The pot was
then adjusted until it read 2.5 volts, or 1/2 the applied no-load
voltage. 2.5 volts occured when the pot was set to 2000 ohms.

So it is safe to say that the DJ+ has at least 2000 ohm pullup.

I further measured at .8 volts and .4 volts, which had 300 and 100 ohms
respectively. You can see that the current draw increases non-linearly
as the voltage drops because you are not only drawing current from the
pull-up, but also from the TTL input.

I also re-measured the actual voltage present when the Atari was pulling
a data bit to zero. That was between .2 and .3 volts, let's say .3.

Actually, let's say .4, because I don't have a current measurement for
.3. .4v/100ohm=.004amp .004amp*.4volt=.0016mw

Now the Atari (according to a quote from a manual) is spec'd to be able to
drive 3000 ohm loads on the data pins. They would have to spec it at the
worst case maximum low voltage level, the TTL standard being 0.8 volts.

If 0.8 volts is at the driver, that leaves 4.2 across the pullup resistor/
TTL input. 4.2volts/3000ohms=.0014amps 1.6 ma is considered a standard
TTL input low load. So it looks like Atari is claiming the data pins can
drive one TTL load.

Power wise, 0.8volts*.0014amps = 0.00112 watts, or 1.12 milliwatts.

So we have the difference between 1.6 and 1.12 milliwatts, the case would even
be better if I had the current measurements for the "real" .2 to .3 volt
logic zero level.

The power difference at this level is miniscule and not worth worrying about.
These drivers are designed to withstand direct shorts to the power rails --
the difference here is piddly in comparison.

Thus I'd say the Atari is quite safe running the DJ+ without buffers (on
everything except the STROBE line, which needs buffering for other reasons
also.)

So, I think my one transistor buffering is a complete solution to the
power-up problem and STROBE loading.

2120. Re: Desk Jet 500

Newsgroup: comp.sys.atari.st
Date: 1990-09-24 20:25:42 UTC
From: rrd@hpfinote.HP.COM
Message-ID: <15330019@hpfinote.HP.COM>
Source record: 238486

Apologies for questioning the person who said that he'd heard of problems getting the DJ+ and ST to talk to each other. I've since heard from someone who documented the problem very well and created 3 workarounds for the problem.

1) Software workaround: A desk ACC which resets the printer i/f before printing. MWC source code follows.

2) Hardware workaround: You solder a resistor into one of the lines. This is documented at several Atari archive sites.

3) Lazy man's workaround: Always turn on the printer BEFORE you turn on the ST. OR, never turn the printer off. (Hey, it's quiet and doesn't use much power ...)

Actually, we never saw the problem at HP because we always kept our ST's DJ+ turned on. Thanks to those who pointed out the problem to me, and apologies again to anyone who was offended by my incredulity.

Now, whether the DJ500 has the same problem: I don't know. I sent a message to the support guys about it, but judging from the Atari's reputation, and the size of its installed base, I don't expect much in the way of an answer. (Flames to /dev/null please, I'm not in Marketing or Finance, where such decisions are made! :-( )

For anyone who wants it, here's the source code. Authors' names are kept intact. Please give credit where it's due.

My husband and I wrote this small Atari ST desk accessory to poll the DJ+ and reset the printer to ``non-busy'' during use. It's written in Mark Williams C and compiled as a desk accessory, not a program (slightly different start-up module).

README:

When you turn on your DeskJet Plus printer *after* your ST has been booted, the printer and the ST won't talk to each other and you can't print anything. The only way, until now, of solving this problem was to reboot the ST (leaving the printer on).

When the printer has been turned on *before* the ST is booted, they will talk to each other just fine. As long as you don't turn off (and on again) your printer, you'll be just fine. I, for one, don't like to leave my printer on all the time. I like to be able to ``compute away'' and turn on the printer only when I actually need to print something. So far, with a DeskJet Plus, this has been impossible.

My husband (Paul Close) and I wrote the following little desk accessory to ``reset'' the printer port and get the DeskJet and the ST talking again. (That's not exactly what it does, but it's close enough.) Much thanks to Moshe Braner for his desk accessory template.

We've included the source code so that you can modify and ``pretty-up'' the DA to your liking. Currently it just blinks the screen when a reset is performed--we didn't add any desktop messages saying ``printer reset'' or anything like that.

Again, apologies to those who may have been offended by my "it works for me" posting. At HP Corvallis, we never saw the problem because we never turned the printer off. It's such a low power-draw, and it's so quiet (YEAH!) that we never bothered with it. See the notestring on the DJ500 if you don't know what this string is talking about.

Oh Yeah, thanks for the NeoCept posting. What happened is that they were in the process of moving while filling my order, and then I was in the process of moving while my order followed the USnail around the Old West. My order finally caught up with me, and as soon as I get my ST unpacked, I will be happy again.

Has anyone heard about how Megamax is doing? I have tried to get in touch
with a human their for awhile. I usually get an answering machine.

Does anyone know how to get a new manual? Mine is worn to death?

Does anyone know how to print out data froma program to the printer.
I usually have to save my output to a file first, then I can print out
the file with another program. There is a command I used years ago to
send a character at a time to the printer, but it was not formated and
it was a pain to use. Do I need to do some special printer processing
(e.g. set up parallel port information) before I can send information
to the print with the "fscanf(STDPRT,...)" command?

Since there is nearly no support for LaserC, I was wondering if I should
change to another C like Mark Williams C. Does anyone have opinions on this?
Thanks.

Please reply directly to me unless you think you input is useful to
lots of people on the net.

Greetings!

Looking for some sort of text based windowing system for the
Atari (the closer to an IBM type character graphics display, the better).
Something with form generating & editing would be a big plus!

I have a slow (old) implementation of curses for the ST, but it
doesn't have support for overlapping windows.

Any help appreciated.

Changing Syquest removable HDs works fine, as long as you format them EXACTLY in the same partioning scheme. Even then, you must clear your desktop, before reading the desktop of the new cartridge.

Reading removable Mac-HDs directly: only if they were formatted with the older system 5.3/3.3, on a real Mac. This is only true for GCR 2.65, I was told. In GCR 3.0 this is fix, I understood from GBS.

Source record: 238413

Okay here's my situation. I've got the chance to get and Atari 520st in Mint condition with two 3.5 drives for $150 from someone who has no use for it. My question is, is this a wise move on my part to purchase this thing I mean what is our there for software and hardware these days. Is there much of a future for this thing or is the ST on it's way out the door? Is the St in itself or through peripherals or software compatible with anything or is it in a world by itself. Basically I know very little about the ST and would like to know a few things good or bad about the machine before I go purchasing it.
Thanks,

Thomas

2131. Adding to Megafile 30

Apology

Mr. Eckert has posted my software WITHOUT MY KNOWLEDGE.
For which I have to apologize.

IN SPITE OF THIS Mr. Eckert has posted an old and buggy version of
my software
As of today it is the newest version available. (see below)

So: Sorry, if there should still be severe errors in the stuff. Don't
blame me, but nevertheless feel free to ring me up if there should be
problems.
Sure, it is not completly bugfree, but which software is ?

A complete distribution of "Rodney's UUCP modules Version 1.16" is
available via Ano. FTP at the following host:

rusmv1.rus.uni-stuttgart.de (129.69.1.12)
The only version of the software I could find there is V 1.14 !!
(I just looked there again - nowhere I could find another version
of Rodney's software)
The one I posted is V 1.15 !

I suggest you use version 1.16, or alternatively wait for the next
posting. I shall post binaries and the source of the stuff at X-mas.
Fine. Please tell me exactly where the newer version on rusmv1 is and
I'll fetch it. Those who can't ftp would not be able to use that
version anyway...

So I suggest the following: If you can't wait until Xmas, don't blame
Rodney for the bugs he didn't fix at V 1.15...
I will prepare a bug-list and (when I got it) a comparison between
1.15 and 1.16 !

Anyway, I'm sorry for not asking Rodney before and apologize for this.

>stereo version in the works.
>
Actually, if I remember right, the important thing about the STe is that it is using 8-bit PCM stereo. If this is true then the STe may well have the best sound of any machine around. (PCM is one on the D to A techiniques used by CD players (though CD's are more often 16 bit) ALso I think the STe is supposed to be tri-aural as opposed to just simply stereo (I know the Tweety board is.)

>out with some great animation and drawing stuff.
>
Thats wrong! The STe incorporates an extra bit plane in several new graphics modes. The extra bit plane is what allows 32 colors without resorting to a seperate color map (ALA Spectrum, GIF's and I belive VGA). As I recall, the graphics modes on the STe are 320x200x16, 640x200x4, 640x400x1 (to remain compatible with the ST) as well as 320x200x32, 640x200x16 and 640x400x4 plus I believe there is also a new Hi-Rez mode somethink like 1280x800x1
(One spec I saw listed in Current Notes stated that the STe and TT were to have remarkably similar graphics..)

>
>Yes. It's the same as the other ST's, only 4096 colors to choose
>from instead of 512.
>

No - I already talked about this...

(Now I'm just waiting for some obvious STe developements (SPectrum 512 in 640x200 mode, an Amiga Emulator, etc, before I buy mine..)
Plus the price is VERY competitive (1 Meg STe with internal 720K drive for less than $600 ($558 I believe))

2135. Dave Bagett's soundtools

Newsgroup: comp.sys.atari.st
Date: 1990-09-25 02:19:58 UTC
From: ripley@opal.cs.tu-berlin.de
Message-ID: <RIPLEY.90Sep25041958@troll.cs.tu-berlin.de>
Source record: 238409

Hello.

Some time ago, Dave Bagett wrote about a conversion utilitiy to convert
sparc-sounds for the ST and (hopefulle) vice versa...
I tried to mail him, but couldn't reach him...

So, Dave, could you send me this tool, or could anybody give me its
exact name on atari.archive ?

Greetings,
RIPLEY

From article <50476@brunix.UUCP>, by mjv@brownvm.brown.edu (Marshall Vale):

> The magazine that I found has some nice technical articles
> is ST World from the UK (not the one from Oregon). It has a very nice
> programming column (Isn't it run by Mathew Lodge? and isn't he on the net?)
> and general reviews. The letters column is a joy since it keeps threads
> of letters going. If I remember correctly, ST World has gone quarterly
> so I guess its even more like STart wanted originally to be.

ST World has indeed gone quarterly, but it's mostly full of reviews (including some large-scale comparative reviews called 'Supertests') and "buyers' guide" information (prices, current software versions, etc.) rather than technical articles.

Mathew Lodge's "Programmer's Clinic" is now in the disk magazine distributed with ST World's sister magazine Atari ST User. (This is monthly, and is more games-oriented.) The Clinic doesn't seem to have as many contributions as it used to. I've not seen Mathew on the net for some time now; I think he lost his Userid at the University of York in the Summer.

The original posting asked about magazines with technical content, even if they weren't in English. I've not seen the German magazine 'ST Computer' for over a year now, but it used to be full of heavy-duty programming articles. Maybe a German contributor could give us an update and the addresses of the better magazines there?

2138. Q: control panel and HD-controller

Newsgroup: comp.sys.atari.st
Date: 1990-09-25 11:48:29 UTC
From: joep@tnosoes.izf.tno.nl
Message-ID: <1362@tnosoes.izf.tno.nl>
Source record: 238414

Two questions, both occurred after installing a new harddisk last
week. It is a 69MB harddisk (Rodime if I'm correct).
Let's start with a 'simple' one:

(1) The mouse-response is very low. For example resizing a window, by dragging
the lower-left corner is hard, because after pressing the mouse-button it
takes about 0.5 second before draws the window rubberband. Also double-
clicking on a folder must be done with care. Double-click and directly
moving the mousepointer downwards causes another folder to be opened.
This problem is caused by the slow mouse-response setting in the control-
panel. After changing this value to '3', the problem is solved. After
a reset, the problem occurs again (saving the desktop doesn't help).
Is this caused by the old tos I use (1.0)?

(2) Internally I swapped my SH204 disk with a 69MB harddisk. It works
fine except for some statistic programs. The new harddisk should be
about 28ms, but RATEHD gives 60ms and another program even -8ms (?!?).
Someone told me that this was caused by an error in the SH204 interface
and that the disk IS 28ms, but different values are returned when
running statistics. Is that possible or what? Is there another way
to check the disks access-time?

G'day,

In article <2301@gmuvax2.gmu.edu>, scoile@gmuvax2.gmu.edu (Steve Coile) writes:

SC> Wow! I'm suitably impressed with the civility of the latest ST-Amiga
SC> cross-over thread (started by PURTRA, or whatever his/her name was).
SC> The lack of harsh words on either side against the other's system is
SC> GREAT!

Steve, perhaps the contributors to this group have struck on a good way to
combat junk (ok, crappy!) postings to this newsgroup of the "Petra type" ?

I'm probably naive but I hope so. If `PC' (generic term) owners who respond
to such attacks remain civil and informative and attack the real problem ie
the "attacking" posters personality problem then we _may_ avoid much of the
wasteful flaming that usually goes on.

SC> Congratulations!

On behalf of the "nice" {oh brother :-)} Amiga reader/posters to this group
I thank you.

SC> -Steve Coile
SC> An ST owner with quite a bit more respect for the Amiga community now.

I genuinely look forward to reading the great news of new Atari products &
mangement policies coming to this group these days.

An Amiga owner with quite a bit of respect for Atari products/community ...

yours truly,
Lou Cavallo. {I apologise if I come across like a sycophant :-(...}

2142. Maps & Legends

Newsgroup: comp.sys.atari.st
Date: 1990-09-25 14:12:26 UTC
From: silvert@cs.dal.ca
Message-ID: <1990Sep25.141226.26858@cs.dal.ca>
Source record: 238421

I just tried to fire up Maps & Legends 2.0 and it crashes. This is my first attempt at running it under TOS 1.4, so I am wondering if there is a TOS compatibility problem there. I disabled most of my TSR's so there doesn't seem to be another cause. Anyone else run into this?

Details: it crashes with 2 or 3 bombs when I try to draw a map. Or it proceeds, but much of the outline is missing. Loading an existing picture works OK.

The system is a 1 Meg 520, mono. I also have a 0.5 Meg 520 with colour monitor, and it runs fine on that, so the software is intact.

>colors, stereo, and 4Mbytes board by using different SIMMs.
>
>The questions that I have are as follow|s:
>
>1. Is there software to take advantage of the new modes

Yes there are several new programs that use the 4096 colour
palette mode. However screen resolution modes havnt changed
so there are few problems with compatability except that the
existing Tos is 1.6 and the newer revised STE's are suppose to
have a newer TOS with fancier Deskstop features.
You wont regret buying an STE for the simple fact their are hundreds
more ST BBS's than Amiga ones because there is little or no Amiga BBS
software avaiable except for the IBM Bridgeboard junk that doest count.
>
>2. What sort of good (ie real time, 640x400x4)4 or 5 or 6)
>animation/painting software is there for the STe

I know of several packages for animation painting for example
Cyber Studio,Aegis Animator and now Phase 4! Phase 4 being the
most recent and versatile of them all. It will be also porte to
the TT as well.

There are many other painting programs like Paint Master, Canvas
Degas Elite, Stos Paint, Spectrum 512 etc. Spectrum being one that
supports brilliant colour display using pixel alliasing.

>3. If I want to run DTP stuff, do I need the monochrome monito{ ?
>
>BTW does STe have high res color, or is it the same as the ST,
>640x200is
>the highest color resolution? Does the STe do full real overscan?

No you dont require a monchrome mointor for many packages but
some are best used in Monochrome mode. Timeworks Deskstop Publishing
that I run is better used in Medium resolution on an RGB Multisync
monitor. (Which for ST bashers handles ALL RESOLUTION MODES!, Including
the new TT resoluton modes.) Analog Multisync RGB Monitors can be bought
cheaply via JDR Microdevices or local IBM clone shop. You can buy used
monochrome monitors for a cheap as 80 bucks used so its not a problem
getting one later on. .

Neocept is not answering their phone; hence this note.
What files must be resident on Wordup version 3.0 disk 5?

Unfortunately, I returned my disk 5 to Neocept when they requesed that I do so, without making a backup on a floppy disk. My backup is on a hard disk. The problem is that the install program requests that I insert floppy disk 5, but when I do so the install pgm does not recognize disk 5. My disk 5 was created by copying files from my hard drive to a floppy; I copied the files which the readme file indicated should be present on disk 5, but I assume that something must be missing. I've tried some possibilities, but to no avail.

This is the TT you're talking about - the STe only has an extra bit
colour resolution (ie. a choice of 16 rather than 8 R, G and B values).
The actual *screen* resolution is the same....

(Unless you know something I don't.....!)

Yes, but..... it has several nasty bugs 8-(. If you back up with it, *DO NOT HAVE AN ALTERNATE FILE SELECTOR IN USE*, or your backup is as good as empty disks. Bug # 2 (personal experience this one, the other was from a review) *DO NOT USE THE "write history to disk" (or something like that) AFTER YOU HAVE DEFRAGGED YOUR PARTITION*. You'll trash the partition. You should *only* defrag another partition or reboot after defragging a partition. Bug #3, it does not support large partitions, including the TOS 1.4 supported 32Meg partitions (same 1K clusters as always 8-). This is for my version dating from summer '89. I called to ask when these and other bugs would be fixed, and haven't heard anything since. Sigh, it's *so close* to being great. I still like it, and use it on my smaller partitions, but be aware of the bugs.

- bit) ALso I think the STe is supposed to be tri-aural as opposed to
- just simply stereo (I know the Tweety board is.)

The STe stills has the same sound chip as the older STs to stay compatible as well as the new chip for the PCM sound. The Tweety Board isn't necessarily stereo; it just separates the three ST voices into different channels. Some of the digitized sound players for the STe allow you to incorporate the old sound chip (forget its name) as well as the new one.

(RE: Graphics)
- Thats wrong!

Ooops! :^)

- The STe incorporates an extra bit plane in several new graphics
- modes. The extra bit plane is what allows 32 colors without
- resorting to a seperate color map (ALA Spectrum, GIF's and I belive
- VGA). As I recall, the graphics modes on the STe are 320x200x16,
- 640x200x4, 640x400x1 (to remain compatible with the ST) as well as
- 320x200x32, 640x200x16 and 640x400x4 plus I believe there is also a
- new Hi-Rez mode somethink like 1280x800x1 (One spec I saw listed in
- Current Notes stated that the STe and TT were to have remarkably
- similar graphics..)

Hmm, this is the first I'm hearing about the new modes for the STe, and, here, I have one! I know that the TT had these modes, but didn't know that the STe had them. I thought it was kinda weird that the JRI 4096 color utilities (which work on the STe) included a program to convert 32-color IFF pics to 32 gray-scale NEO pics. Is that a result of the 320x200x32 mode?

Now all we need is software to use these modes!

Hi All,
This might be allready known but...I've been using Uniterm for three years now, and I just discovered something new (to me any way)
If you load in a controll panel, and make any changes, ie. color or any other change, if you save the setup in Uniterm, the changes will stay even after you remove the control panel.
I'm sure it was allready known, but just in case!

>is available? Are A24/D16 and A16/D8 the only supported modes?
>(A16/D16 would be nice.) Is host memory accessible by VME bus
>masters?

I misspoke: A16/D16 is available.

There is only one slot, but I have seen a new box for the TT030 with many VME slots -- this was from another company, in Germany, but it proves it can be done. I think the internal slot is half-Eurocard, 3U. If I'm abusing the VME terminology, I apologize: I don't really grasp it myself. The cards I've seen that fit are about 6.5" by 4.5".

Host memory is not accessible through the VME bus -- that is, a VME card in the TT030 cannot be a bus master. My standard answer on this subject is as follows: "It is not unreasonable to suppose that there may be a future machine from Atari with a full-size, full-feature, multi-slot VMEbus interface."

2157. ST books

Newsgroup: comp.sys.atari.st
Date: 1990-09-25 21:33:48 UTC
From: gow@sakari.mrceg
Message-ID: <GOW.90Sep25163348@sakari.mrceg>
Source record: 238440

I was told yesterday that Abacus has discontinued their ST book series. I am thinking of buying an ST as a development platform but I need to know what's in there. So, please, in as much detail as possible, where can I get information about the ST hardware and about TOS? Which books are best for details about the cartridge port signals and timings, bus, DMA connector, TOS internals, and device drivers. If they are as non-existant as they seem then Atari has a problem. Your help will be appreciated.

-Ed

Hi,
Calamus will not run on your ST with _SCANDINAVIAN_ TOS because it is
not supposed to. This is probaly one of oldest copy protection schemes for
the Atari. It prevents Pirated software to be spread across the world.

(My older copies of Turbo C used the same scheme, v2 does not. (in fact
it was only MAS and BUG that was protected)).

Hi,

Here is a simple patch to enable 'whattahech' to run on the STe:

After you have extracted the MSA file on a disk you start your fave
disk editor and write the following in the bootsector :

Address Value
206(dec) 2e 3c 00 00 3a bc
510(dec) d2 52

that it...
(some of the demos with overscan work, and some don't (they flicker a bit))

Well, you got me curious, so go ahead and explain it. There's a bug
in the 68030 design that can be fixed via the MMU? Is it perhaps
related to the behavior of the instruction and data caches?

2164. LaserC ASCII to floating point conversion

Newsgroup: comp.sys.atari.st
Date: 1990-09-26 03:12:12 UTC
From: jlf@cs.wvu.wvnet.edu
Message-ID: <896@h.cs.wvu.wvnet.edu>
Source record: 238425

Has anyone out in the ST net.world had problems with Laser C's floating point conversions to from ASCII to FP? More specifically, with numbers in scientific notation? I've used atof and sscanf and both seem to ignore the "e" part. My code contains the following declarations:

```
char *buffer;
float float_num;
```

buffer is pointing to a string that contains "2.34e+02\0" and everything I've tried returns the value 2.34 in float_num. Here's what I've tried:

```
float_num = (float) atof(buffer);
sscanf(buffer, "%f", &float_num);
sscanf(buffer, "%e", &float_num);
sscanf(buffer, "%g", &float_num);
```

I'm using version 2.1 of LaserC. I'd hate to have to write my own conversion routines, but I need this to work by Friday and this is the last problem I'm having.

If this is a bug in the library routines, does anybody have the sources for a conversion routine that does work? No need to waste bandwidth so please reply by mail to the address below (that is if our news poster doesn't eat my .signature). Thanks to all in advance.

In response to question about the STe... the data I was refering to was
from an issue of Current Notes about three months old.. in an Article
describing an Autralian atari fair there was a sidebar containing info on the
STE (can't check as I and the magazine are now 1900+ miles apart) ..
I remember that at that time the STe was supposed to incorporate some
major graphics changes (ie.. an extra bit plane.) ... hopefully it does,
as that would make the machine equal to the Amiga graphics wise.. otherwise it
is rather a pointless and late upgrade.. (Sorry, but its time for the TT or
even better the ATW... (but following Dave Small's advice.. with which I agree,
no Atari bashing...)
I know some actual atari reps read this conf. perhaps they can tell us
the true story...

>
>Now all we need is software to use these modes!

In order to use more than 16 colors without a color map and funny routines (Spectrum!) you have to have more than 3 bit planes.. (2^3)= 16 thus only sixteen colors... but with four bit planes (2^4) one would have 32 colors. One side effect would be larger files... As simple way to check the converted files is to check files size if they are about 32K then they probably only have 16 colors (more obtained by clever dithering).. but if they are noticably larger they probably include more bit planes... (This is a side effect of the .NEO format.. it is essentially pallete data followed by a straight screen dump.... obviously this wouldn't work to tell with a compressed file (TNY or PC?).

Keywords:

I am having some problems with a number of files I have downloaded
from terminator (atari.archive.umich.edu). Any help would be
appreciated. Please reply via email.

1) genesis.tos - puts up blank white screen but doesn't appear to
do anything else.

2) magic - puts up sparkling colors when mouse moves. Unfortunately,
these appear in two places, neither of which is near the
mouse cursor.

3) quartet - drops three bombs. This one I don't care that much
about since it appears to be an advertisement.

I also have some general questions:

o How can I specify the order of execution of programs
in my auto folder?

o Can someone give me a comprehensive explanation of
GDOS? I have a copy of it but have no idea
what should be in the assign.sys file. Is
GDOS only relevant if you are running certain
applications?

I have a 1040 ST running TOS 1.4 with a color monitor (SC1224).
Pretty standard stuff. I'm sure there are simple explanations
for my problems (at least I hope so). Thanks for any help.

This is not meant as a Bash to Mint. It certainly sounds nifty to me and I think it's great that someone would dedicate the effort to a project like that.

But some things were mentioned about MT C-Shell that I'd like to dispute.

It was implied that MT C-Shell doesn't have pipes or ptys and this simply isn't true. Micro RTX implements GEMDOS level pipes, and the shell in MT C-Shell uses them when pipelines are used on the command-line. The programs run concurrently and pipe each other data using interprocess communication.

Also, using the flexible installable device driver mechanism of Micro RTX, I have implemented a PTY driver, which I give away to registered owners of MT C-Shell free of charge. I may also post this RTX PTY driver to the net, GEnie, and other places too.

I hope to get a chance to play with Mint pretty soon. It sounds great. Perhaps I can make some utilities for it and maybe some kind of RTX/Mint compatibility can be achieved in the future.

The "4096-color-compatible" NEO pics I have are 32768 bytes long.
They have supposedly 32 colors.

2170. AMC-GDOS fonts to GDOS fonts

Newsgroup: comp.sys.atari.st
Date: 1990-09-26 09:29:24 UTC
From: J.D.Coleman@newcastle.ac.uk
Message-ID: <1990Sep26.092924.23920@newcastle.ac.uk>
Source record: 238444

I am having problems with AMC-GDOS in that some Gem programs cause the error :

```
---------------------------------------
| /--\ |
| |STOP| GDOS-Error : invalid handle |
| \--/ |
| -------- |
| | QUIT | |
| -------- |
---------------------------------------
```

Having written a program to look into this, it occurs when opening or closing a virtual screen workstation. This error only occurs with AMC-GDOS and not Atari GDOS.
Any ideas, anyone?
The versions of GDOS I have are :

AMC-GDOS Release 3.20 CRX (UK) { Came with Gemini1.1 - neat program :-) }
Atari GDOS release 1.1 { Came with Opus2.2 spreadsheet }

A solution (sort of) would be to use Gemini with Atari GDOS but ...
... How do I convert the Gemini fonts to work with Atari GDOS?

Thanks in advance for any info,

Julian

The SH204 host adapter doesn't return any status other than 0. This makes
many programs go wild that try to get some error codes from your hard disk;
maybe including the access rate test programs you were using.

This reminds me that I wanted to post my new CHECKHD version on the net.
This is a hard disk test program of mine. I never posted a program, so
can somebody possibly help me? Tnx so much.

I have to agree, people don't understand the power of multi-tasking untill they have it. Right now, on my Amiga, I am ray-tracing an animation, and working on an article for ST Report, and typing here. It was announced at Glendale that Atari is working on a multi-tasking TOS (I won't hold my breath) and when that becomes available I am sure I will be using my ST more then I do now.

>%%[
> *]%%

I've experienced the same with PageStream 1.8 on the Amiga when
printing to a Linotronic L100. Just remove the garbage after '% End Page'
and your problem is solved.

2178. Michtron tools

Newsgroup: comp.sys.atari.st
Date: 1990-09-26 12:31:07 UTC
From: TS0026@OHSTVMA.IRCC.OHIO-STATE.EDU
Message-ID: <9009261231.AA25433@nisca.ircc.ohio-state.edu>
Source record: 238301

Unfortunately, my experience with the Michtron tools has been poor.
Not all bad mind you but bad enough that I don't trust them any more.
I had trouble with all forms of their backups indicating a bad sector
on my hard disk while writing to floppy during backs. Since nothing
indicated any trouble with the hard disk, I called for consultation.
The guy I talk to told me everything that was wrong with everyone
else's programs but was ABSOLUTELY no help with my problem.

He even got off on the IBM/PC tool (PC Tools Deluxe) and how their
disk compress (on PCs mind you) would destroy directories, etc (it
doesn't EVER is my experience). In any case, the problem I finally
found was an allignment problem in my FLOPPY drive. That guy didn't
know anything, as far as I am concerned and the error msg was JUNK.
It was a totally wasted phone call. :-(

Now, in fact, I can and have successfully done both file level and TAR
backups (and restores) with UI II loaded (so much for the claim that
it is the problem!) I now only use the tools under highly-backed-up
conditions. It is the only "compressor" that seems to work well.
I don't like the fact that it doesn't really tell you what it is doing
or what it has done. I like "pictures", if it displayed a map of
the sectors of the disk and showed me what it did, maybe I would be
happier.

In any case, use disk compression tools CAREFULLY. They can be abused!

I recently bought DimondBack II and intend to use it for backups.

2180. XBRA map: where is SYSMON?

Newsgroup: comp.sys.atari.st
Date: 1990-09-26 13:15:08 UTC
From: jeroen@pluto.phil.ruu.nl
Message-ID: <761@accucx.cc.ruu.nl>
Source record: 238442

I've read an article in a recent German magazine reviewing a shareware program called SYSMON, which could tell about resident programs being active, their names, their XBRA ids, the cookies in the jar, and it could trace bios/xbios/gemdos/vdi/aes calls too. Looks like every serious programmer could use this.

Now where can we all get this neat thing?

Tell me and I'll be forever greatful (well, for quite some time anyway).

healy@cod.NOSC.MIL (Mike Healy) writes:

- 1) genesis.tos - puts up blank white screen but doesn't appear to do
- anything else.

Dunno. It works on my STe. Maybe something was wrong during the
download.

- 2) magic - puts up sparkling colors when mouse moves. Unfortunately,
- these appear in two places, neither of which is near the
- mouse cursor.

Yeah, the sparkling colors aren't right near the mouse; they're at
about "2 o'clock" and "10 o'clock." I think it's supposed to be this
way.

- 3) quartet - drops three bombs. This one I don't care that much
- about since it appears to be an advertisement.

But it sounds good. :^) I don't know about this either. Again,
I'll say that maybe it was the download. Did you turn on binary
before you ftp'ed them? Do you have any TSRs or desk accs loaded?

- o How can I specify the order of execution of programs
- in my auto folder?

NeoDesk 3.0 will supposedly have a command for this. Otherwise,
there are two programs I know of, AUTOSORT and FLDRSRT (Folder Sort).
Autosort is has only room for about 20 AUTO folder programs. I say
'only' because hard drive users usually have more. I even sent the
author shareware money and asked him to add more slots. Well, my
check went through but no changes. :^(So, now I use FolderSort. :^)
It uses up the whole screen and can organize any folder on any drive,
not just the AUTO folder. I put FLDRSRT.LZH on atari.archive; I'm
not sure if AUTOSORT is there.

- o Can someone give me a comprehensive explanation of
- GDOS? I have a copy of it but have no idea
- what should be in the assign.sys file. Is
- GDOS only relevant if you are running certain
- applications?

Yeah, it only works with applications that use it. These
applications are ones that require the use of fonts, although some
programs have their own font drivers and don't use GDOS.

>
>Incidentally, many, many "non-copy protected" programs can only be
>copied as files. Seems there are a lot of weird disk formats floating
>around out there...

I guess I would have to agree with you there. For instance the
Union Demo couldnt be copied because it was using 1024 byte sectors
which means most existing copiers would cough and die. However
there are a few intellegent copiers out there that check sector
size etc. The Union demo used 512 byte sectors for the first three
sectors then resorted to 1024 byte sectors for the rest. Of course
you need a special formatter for it and at one time hypercopy had
this built into it. Other manufacturers are using laser holes to
identify disks they sent out as compared to backup disks which
wouldnt have the holes which send out a distinct error code.

With all the time spent into protecting the software it would be
wiser to track down the culprits that leak out software before
it has hit the market. Sometime this is done via backdoors other
times it is a result of theft at a computer show.

In case anyone is interested I phoned Intersect Software to find
out that it still exist despite that their BBS isnt operational.
They are switching to Unix software and will be back online in
about a month. They still have Interlink 1.8 for sale at 39.95
and also have Masterlink for sale at 59.95. I am sure if you
have seen Interlink you will more impressed with Masterlink.
It allows vt100,vt52,ansi and many other modes. If I am correct
I think he mentioned it required over 1 meg to use all functions
simultaneously. Masterlink he said would be released in about
a months time. It is suppose to be the ultimate terminal software!
Supports many protocls with many emulations besides all of
interlinks old features

Intersects BBS number is (813) 924-4590 when it goes back online

Prices are listed in US dollars.

If you're planning to do any serious programming on the ST, I cant recommend developer registration highly enough. The documentation in the developers kit is substantial; the standard tools in the kit include some VERY useful ones, and most to the point, Atari developers support has straightened out unbelievably much in the last few months. If Atari ever improves their customer support that much, they might become a market force to be reckoned with.

Consider how much you'd pay for half a dozen third party books. Throw in a helpful person a phone call away and a couple of utility programs. How bad a bargain could the equivalent be at about $250?

Another thing: while you can get an awful long way with one machine, I'm learning that as a product nears commercial release reasons develop for having several machines: need for several TOS versions, separate test and development environments, untimely hardware failures and more. Makes the developer discount program invaluable.

>Well, you got me curious, so go ahead and explain it. There's a bug
>in the 68030 design that can be fixed via the MMU? Is it perhaps
>related to the behavior of the instruction and data caches?

It's a data cache anomaly. There are two data caching modes, standard and write allocate; the latter is required for cache consistency when user and supervisor data spaces access the same logical memory. However, in write allocate mode, the data cache is updated on writes. If you write a longword aligned longword to a longword port, the cache entry is marked valid. In all modes, the write cycle ignores the CIIN* signal (hardware driven cache inhibit), so this can be a problem in dealing with things like 32 bit I/O registers, since you'll end up caching the register even if hardware tries to inhibit such caching (which would be natural for any I/O operation). While there are several ways around this problem, the simplest is to use the MMU and make all your I/O pages uncachable. The caches always obey the MMU table entry...

Sounds like a very good idea. Actually, how 'bout creating an
array of function pointers and letting crt0 initialize it to the
appropriate calls... That would prevent wasting time testing
variables all the time...

I've been working on this sort of thing for RTX and MWC, but
it's kind of slow work, figuring out all the routines you want
to change and such. (But now I have the Beckemeyer Software
Development System, and expect that things will go much more
quickly from there...)

> Yep! Here's an other vote for c.s.a.s.g.

If anyone feels strongly that a games newsgroup is merited, the procedure for establishing newsgroups is well-documented and posted periodically to news.announce.newusers, news.groups, and news.admin.

I don't think establishing comp.sys.atari.st.games is a good idea. "Amiga has one" is not an argument that I find persuasive. Proliferating newsgroups willy-nilly is dangerous. At some point, news administrators (or perhaps their bosses) will say, "Enough is enough!" and start pulling plugs.

We are experiencing propagation problems with comp.sys.atari.st.tech, and perhaps as a result there are many postings in this newsgroup that belong in the technical discussion. The dust should be allowed to settle from that fairly recent change before considering another split of the ST groups.

So Tom,

Who have you been talking to at Atari?? Give me a shout, I'm the manager of user group services. 408-745-2052 voice, or fax 408-745-2088.

Let's try to fix the problem for *both* of us.

2201. Re: Purchase decision, to STe or not?

>
>The "4096-color-compatible" NEO pics I have are 32768 bytes long.
>They have supposedly 32 colors.

Actually... I just punched some numbers into my calculator...
(320*200*3)= 192000/8 = 24000 = 24K
Which is how long a 320x200x3bit plane screen dump should be...
32K is how long a four bit plane dump should be...

I know for a fact that atari uses 32K for its screen dump... I wonder what that means ... did atari intend to include 4 bit planes (like the amiga) on the original ST and then kludge it? (or am I missing something big..)

I guess this means that you can't tell by file size...though it also means that the Ste might still have only three modes... but be able to display more colors in each mode.. (If one bit plane is unused then using it would allow compatibility between STe and Non-Ste modes..) ^in the ST.

Hm... I wish I had an Ste... then I could test this... though it seems kind of stupid for atari to have included and extra bit for the color pallette but not for the display.. waste of time if you ask me...)

If someone out there is a programmer .. write a short program in low rez to try and put 32 colors on screen...
(Though this will only tell if it is possible... not neccessarily if it is impossible..)

Just a thought.. high rez in color would probably take a special monitor.. since the SM124 doesn't have any colored phosphor...

JEff

(Oh 2^3 = 8... 8+4+2+1 = 15 0-15 equals sixteen colors...)

2202. What's an XBRA?? (was Re: XBRA register)

Would someone please explain to me what an XBRA is? I've programmed
the ST for a couple of years, and have the DevKit (though I'm still not
registered -- I'm trying to figure out what my position as a freeware and
shareware programmer would be). But I've never heard of XBRA!

>gnu.olb to recognise and use MiNT, porting programs will be

Yes, a good UNIX clone library. But why alone for gnu? I'd really like to see one for Turbo C. It would be nice for the extra speed and smaller binaries (and because I have TC, but cannot run gnu in 1 Mb).

When I have time, I'll try to port the MinT sources to TC.

2205. Q: spectre and 69MB harddisk

Newsgroup: comp.sys.atari.st
Date: 1990-09-27 07:23:02 UTC
From: joep@tnosoes.izf.tno.nl
Message-ID: <1363@tnosoes.izf.tno.nl>
Source record: 238327

I just installed a 69MB harddisk and know I'm wondering if
it's still possible to use Spectre on this (non-atari) harddisk?

Has somebody already tried this? What's the spectre limit?

I'm still using tos 1.0, but I'll get 1.4 in 2 weeks. The
harddisk is a Rodime 3085S (?!) and the controller a 3000S.

Source record: 238320

This is to Dave Backemeyer; I couldn't reach him via
mail, but I think it could be of interest for others, too.

I just received MiNT and checked it out a bit, and I found it's running
very well with Beckemeyers Micro-Cshell. (Note that the Micro-Cshell
has nothing to do with multitasking; it's simply a C-Shell for the ST).
The next thing I'm going to do, is to adapt Mercury UUCP to mint, and
make Rnews, Rmail - and perhaps a cron? - run in background.

One thing we still need, is a good shell. I have read the source of
Gulam; it's fast, but has only little to do with a real C-Shell.
Another possibility would be BASH, but BASH uses far too much memory.

Dave; I suggest you make your Micro-CSH free- or shareware; I'll do the
same thing with Mercury UUCP. A further problem is our UUCICO: it's
written in GFA-Basic, does system calls, and is therefore not usable
with MiNT. Beckemeyer's uucico - which is derived from GNU-UUCP, I
think - should solve the problem.

So we could have:

- Multitasking (Mint)
- A window-System (MGR, perhaps sometimes even X)
- Usenet connection with Mail and News (Mercury UUCP)
- A Unix-Cshell

...and all that available with the full sourcecode.
I mean, isn't that worth thinking about?

ST-Users and -programers, unite and work together! :-)

Well Falcon (an F-16 simulator) is one of the best. I believe that Flight
Simulator II is available for the Atari. You might also look at Battle of
Britain if you like older planes...lot's of fun.

Shared libraries would handle this quite neatly. The basic concept is to edit the programs runtime binding so that function calls are made directly to the library functions (ie, without indirection or table lookup).

Another possibility is a GNUware program I got off the net, called dld, a dynamic loader.

Where else if not at cs.uni-sb.de [134.96.7.254] ? :-).
Look for /pub/atari/tools/sysmon.tos (a self-unpacking lharc-archive). It is
one of the best programming utilities that i have ever seen on the ST (and it
knows some of the XBRA-Id's that i am using :-). I have sent in my
shareware-contribution 2 days after i've seen it.

The point with MARK and RELEASis:
- You run MARK
- You run a number of programs that stay resident...
- You run RELEE

All programs installed betweeen MARK and RELEASE is removed but none of the
one installed before the MARK command....

Don't laugh! I'm fairly new to this whole concept of FTP file
transfers and it didn't bother me a bit until today when I got an account
on a VAX at OSU. It has an option of going into an FTP and I don't know
how to use it and second of all what to use it with.

Could someone explain the whole concept to me and write me how to
get these tranfers to "GO". Are they binary or just ASCII coded binary?
(I've had some problems with my copy of uuencode and uudecode).

E-mail, please, cuz I don't wanna try other user's patience who've
read about it before over and over again.

Introductory Information
----
word = 2 bytes
long = 4 bytes
palette = Hardware color palette, stored as 16 words. First word is
color register zero (background), last word is color register
15. Each word has the form:

Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 0 0 0 0 R2 R1 R0 0 G2 G1 G0 0 B2 B1 B0

R2 = MSB of red intensity
R0 = LSB of red intensity

G2 = MSB of green intensity
G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest
intensity).

Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)

Caveat: It is wise to mask off the upper four bits of each
palette entry, since a few programs store special
information there (most notably Art Studio).

The Formats

<NEOchrome> *.NEO

1 word flag byte [always 0]
1 word resolution [0 = low res, 1 = medium res, 2 = high res]
16 words palette
12 bytes filename [usually " . "]
1 word color animation limits. High bit (bit 15) set if color
animation data is valid. Low byte contains color animation
limits (4 most significant bits are left/lower limit,
4 least significant bits are right/upper limit).
1 word color animation speed and direction. High bit (bit 15) set
if animation is on. Low order byte is # vblanks per step.
If negative, scroll is left (decreasing). Number of vblanks
between cycles is |x| - 1
1 word # of color steps (as defined in previous word) to display
picture before going to the next. (For use in slide shows)
1 word image X offset [unused, always 0]
1 word image Y offset [unused, always 0]
1 word image width [unused, always 320]
1 word image height [unused, always 200]
33 words reserved for future expansion
16000 words picture data (screen memory)

32128 bytes total

<NEOchrome Animation> *.ANI

NOTE: To get this feature on versions 0.9 and later select the Grabber
icon and click both mouse buttons in the eye of the second R in the
word GRABBER.
Interestingly enough, some versions of NEO only require you
to press the right button, not both. Hmmm...

1 long magic number BABEEBEA (hex) (seems to be ignored)
1 word width of image in bytes (always divisible by 8)
1 word height of image in scan lines
1 word size of image in bytes + 10 (!)
1 word x coordinate of image (must be divisible by 16) - 1
1 word y coordinate of image - 1
1 word number of frames
1 word animation speed (# vblanks to delay between frames)
1 long reserved; should be zero
----
22 bytes total for header

```
? words image data (words of screen memory) for each frame, in
order

<DEGAS> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
-----------
32034 bytes total

<DEGAS Elite> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)
-----------
32066 bytes total

<DEGAS Elite (Compressed)> *.PC1 (low resolution)
*.PC2 (medium resolution)
*.PC3 (high resolution)

1 word resolution (same as Degas, but high order bit is set;
i.e., hex 8000 = low res, hex 8001 = medium res,
hex 8002 = high res). Other bits may be used in the
future; use a simple bit test rather than checking
for specific word values.
16 words palette
< 32000 bytes control/data bytes
4 words left color animation limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag [0 = left, 1 = off, 2 = right]
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)
-----------
< 32066 bytes total

Compression Scheme:
```

PackBits compression is used (see below). Each scan line is compressed separately; i.e., all data for a given scan line appears before any data for the next scan line. The scan lines are specified from top to bottom (i.e., 0 is first). For each scan line, all the data for a given bit plane appears before any data for the next higher order bit plane. Note this is identical to the IFF 'BODY' image data.
To clarify: The first data in the file will be the data for the lowest order bit plane of scan line zero, followed by the data for the next higher order bit plane of scan line zero, etc., until all bit planes have been specified for scan line zero. The next data in the file will be the data for the lowest order bit plane of scan line one, followed by the data for the next higher order bit plane of scan line one, etc., until all bit planes have been specified for all scan lines.

Caveats:

DEGAS Elite's picture loading routine places some restrictions on compressed DEGAS files:

o Elite uses a 40-byte buffer to store data being decompressed.

o Whenever a control command is encountered, bytes are stuffed in this buffer.

o The buffer is only emptied when there are EXACTLY 40 characters in it.

The important conclusion here is that

No control command may cause the buffer to have more than 40 bytes in it. In other words, all control commands must end on or before the 40-byte boundary.

Any picture violating the last condition will cause Elite to get a bus error when the picture is loaded.

<Tiny> *.TNY (any resolution)
*.TN1 (low resolution)
*.TN2 (medium resolution)
*.TN3 (high resolution)

Several people have reported sightings of mutated Tiny pictures that do not follow the standard format, so let's be careful out there. What is described here is the format that David Mumper's original TNYSTUFF.PRG produces.

1 byte resolution (same as NEO, but +3 indicates rotation information also follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits hold left (start) limit; low 4 bits hold right (end) limit
1 byte direction and speed of color animation (negative value indicates left, positive indicates right, absolute value

```
is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)
}

16 words palette
1 word number of control bytes
1 word number of data words
3-10667 bytes control bytes
1-16000 words data words
-------------
42-32044 bytes total

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 word is taken from the control section which specifies
the number of times to repeat the next data word (from
128 to 32767)
x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

Format of expanded data:

The expanded data is not simply screen memory bitmap data; instead, the
data is divided into four sets of vertical columns. (This results in
better compression.) A column consists of one specific word taken
from each scan line, going from top to bottom. For example, column 1
consists of word 1 on scanline 1 followed by word 1 on scanline 2, etc.,
followed by word 1 on scanline 200.
The columns appear in the following order:

1st set contains columns 1, 5, 9, 13, ..., 69, 73, 77 in order
2nd set contains columns 2, 6, 10, 14, ..., 70, 74, 78 in order
3rd set contains columns 3, 7, 11, 15, ..., 71, 75, 79 in order
4th set contains columns 4, 8, 12, 16, ..., 72, 76, 80 in order

Note that Tiny partitions the screen this way regardless of resolution; i.e.,
these aren't bitplanes. For example, medium resoltion only has two bitplanes,
but Tiny still divides medium resolution pictures into four parts.

<Spectrum 512> *.SPU

80 words first scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)
-----------
```

51104 bytes total

<Spectrum 512 (Compressed)> *.SPC

1 word flag word [$5350 or "SP"]
1 word reserved for future use [always 0]
1 long length of data bit map
1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map

<= 50014 bytes total

Data compression:

Compression is via a modified run length encoding (RLE) scheme,
similar to DEGAS compressed and Tiny. The data map is stored as a
sequence of records. Each record consists of a header byte followed by
one or more data bytes. The meaning of the header byte is as follows:

For a given header byte, x:

0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x <= -1 Use the next byte -x + 2 times

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map compression:

Each 16-word palette is compressed separately. There are three
palettes for each scan line (597 total). The color map is stored as a
sequence of records. Each record starts with a 1-word bit vector which
specifies which of the 16 palette entries are included in the data
following the bit vector (1 = included, 0 = not included). If a palette
entry is not included, it is assumed to be zero (black). The least
significant bit of the bit vector refers to palette entry zero, while the
most significant bit refers to palette entry 15. Bit 15 must be zero,
since Spectrum 512 does not use palette entry 15. Bit 0 should also be
zero, since Spectrum 512 always makes the background color black.
The words specifying the values for the palette entries indicated in
the bit vector follow the bit vector itself, in order (0 - 15).

<Art Director> *.ART (low resolution only)

16000 words picture data (screen memory)
16 words palette
15 * 16 words 15 more palettes for animation

```
-------------
32512 bytes total

<C.O.L.R. Object Editor Mural> *.MUR (low resolution only)

16000 words picture data (screen memory)
(palettes are stored in separate files)
-----------
32000 bytes total

<Doodle> *.DOO (high resolution only)

16000 words picture data (screen memory)
-----------
32000 bytes total

<Animatic Film> *.FLM (low resolution only)

1 word number of frames
16 words palette
1 word speed (0 - 99; value is 99 - # vblanks to delay between frames)
1 word direction (0 = forwards, 1 = backwards)
1 word end action (what to do after the last frame)
0 = pause, then repeat from beginning
1 = immediately repeat from beginning
2 = reverse (change direction)
1 word width of film in pixels
1 word height of film in pixels
1 word Animatic version number (major)
1 word Animatic version number (minor)
1 long magic number 27182818 (hex)
3 longs reserved for expansion (should be all zeros)
--------
32 words total for header

? words image data (words of screen memory) for each frame, in order

<GEM Bit Image> *.IMG

1 word version number of image file [1]
1 word length of header in words [usually 8]
1 word number of color planes [1 for monochrome]
1 word pattern length in bytes [1-8, usually 2 for screen images]
1 word pixel width in microns (1/1000 mm, 25400 microns per inch)
1 word pixel height in microns
1 word line width in pixels
1 word number of lines
-------
? words header length defined in 2nd word of header

? bytes data

NOTES: If the image is a color image (planes > 1), the planes are stored
separately starting with plane 0. There is, however, no standard way of
```

storing the color palette. Some programs may save the palette in separate files, some may extend the header. For this reason, you should never assume the header is 8 words long, always get the header length from the 2nd word of the header. Also, the line width in the 7th word is the number of pixels in a line. Since the data is encoded in byte-wide packets, the actual unpacked line width is always a multiple of 8, and may be 1-7 pixels longer than the length specified in the header.

For each byte x in the data section,

x = 0 Pattern/scanline run.
Read the next byte, n (unsigned).

If n > 0 then:
Read a number of bytes equal to the "pattern length" word in the header. Repeat this pattern n times.

If n = 0 then:
Scanline run. Data for the next scanline is to be used multiple times. Read the following record:

1 byte flag byte [$FF]
1 byte number of times to use
next scanline data

The data for the next scanline follows, compressed normally.

x = 80 (hex) Uncompressed bit string. The next byte determines the number of bytes to use literally. The literal data bytes follow.

otherwise Solid run. The value of x determines what to draw. The high bit specifies whether the pixels are set or cleared. A 1 indicates a byte-run using $FF, a 0 indicates a byte-run using $00. The low 7 bits, taken as an unsigned quantity, specify the length of the run in bytes.

<STAD> *.PAC (high resolution only)

4 bytes "pM86" (vertically packed) or "pM85" (horizontally packed)
1 byte id byte
1 byte pack byte (most frequently occuring byte in bitmap)
1 byte "special" byte
----
7 bytes total for header

? bytes data

The data is encoded as follows. For each byte x in the data section:

```
x = id byte Read one more byte, n. Use pack byte
n + 1 times.
x = "special" byte Read two more bytes, d, and n (in order).
Use byte d n times.
otherwise Use byte x literally.

<Imagic Film/Picture> *.IC1 (low resolution)
*.IC2 (medium resolution)
*.IC3 (high resolution)

4 bytes "IMDC"
1 word resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
1 word date (GEMDOS format)
1 word time (GEMDOS format)
8 bytes name of base picture file (for delta compression), or zeroes
1 word length of data (?)
1 long registration number
8 bytes reserved
1 byte compressed? (0 = no, 1 = yes)

If compressed {
1 byte delta-compressed? (-1 = no, > -1 = yes)
1 byte ?
1 byte escape byte
}
-------
65 bytes total for header (68 bytes if compressed)

? bytes data

Compressed data may be either stand-alone or delta-compressed (relative
to the base picture named in the header). Delta compression involves
storing only how the picture differs from the base picture (i.e., only
portions of the screen that have changed are stored). This is used to
to encode animated sequences efficiently.

Compressed data, stand-alone:

For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

If n >= 2, use the next byte n times.
If n = 1, keep reading bytes until a
byte k not equal to 1 is encountered.
Then read the next byte d.
If the number of 1 bytes encountered is o,
use d (256 * o + k) times. I.e.,

if (n == 1) {
o = 0;
while (n == 1) {
o++;
```

```
n = next byte;
}

k = n;
d = next byte;

Use d (256 * o + k) times.
}
else {
d = next byte;
Use d (n) times.
}

x != escape byte Use x literally.

Compressed data, delta compressed:

For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

If n >= 3, use the next byte n times.
If n = 1, do the same as for n = 1 in
stand-alone compression (above).
If n = 2, then set n = next byte.
If n = 0, end of picture.
If n >= 2, take n bytes from base
picture.
If n = 1, do the same as for n = 1
in stand-alone compression (above),
but take (256 * o + k) bytes from
base picture.

x != escape byte Use x literally.

<IFF Format> *.IFF

4 bytes "FORM" (FORM chunk ID)
1 long length of file that follows
4 bytes "ILBM" (InterLeaved BitMap file ID)

4 bytes "BMHD" (BitMap HeaDer chunk ID)
1 long length of chunk [20]
20 bytes 1 word = image width in pixels
1 word = image height in lines
1 word = image x-offset [usually 0]
1 word = image y-offset [usually 0]
1 byte = # bitplanes
1 byte = mask (0=no, 1=impl., 2=transparent, 3=lasso)
1 byte = compressed [1] or uncompressed [0]
1 byte = unused [0]
1 word = transparent color (for mask=2)
1 byte = x-aspect [5=640x200, 10=320x200/640x400, 20=320x400]
1 byte = y-aspect [11]
```

```
1 word = page width (usually the same as image width)
1 word = page height (usually the same as image height)

4 bytes "CMAP" (ColorMAP chunk ID)
1 long length of chunk [3*n where n is the # colors]
3n bytes 3 bytes per RGB color. Each color value is a byte
and the actual color value is left-justified in the
byte such that the most significant bit of the value
is the MSB of the byte. (ie. a color value of 15 ($0F)
is stored as $F0) The bytes are stored in R,G,B order.

4 bytes "CRNG" (Color RaNGe chunk ID)
1 long length of chunk [8]
8 bytes 1 word = reserved [0]
1 word = animation speed (16384 = 60 steps per second)
1 word = active [1] or inactive [0]
1 byte = left/lower color animation limit
1 byte = right/upper color animation limit

4 bytes "CAMG" (Commodore AMiGa viewport mode chunk ID)
1 long length of chunk [4]
1 long viewport mode bits (bit 11 = HAM, bit 3 = interlaced)

4 bytes "BODY" (BODY chunk ID)
1 long length of chunk [# bytes of image data that follow]
? bytes actual image data

NOTES: Some of these chunks may not be present in every IFF file, and may
not be in this order. You should always look for the ID bytes to find a
certain chunk. All chunk IDs are followed by a long value that tells the
size of the chunk. This is the number of bytes that FOLLOW the 4 ID bytes
and size longword. The exception to this is the FORM chunk. The size
longword that follows the FORM ID is the size of the remainder of the file.
The FORM chunk must always be the first chunk in an IFF file.

The R,G,B ranges of AMIGA and ST are different (AMIGA 0...15, ST 0...7),
as is the maximum number of bitplanes (AMIGA: 5, ST: 4).

Format of body data

An expanded picture is simply a bitmap. The packing method is PackBits
(see below), and is identical to MacPaint and DEGAS Elite compressed.

The (decompressed) body data appears in the following order:

line 1 plane 0 ... line 1 plane 1 ... ... line 1 plane m
[line 1 mask (if appropriate)]
line 2 plane 0 ... line 2 plane 1 ... ... line 2 plane m
[line 2 mask (if appropriate)]
...
line x plane 0 ... line x plane 1 ... ... line x plane m
[line x mask (if appropriate)]

The FORM chunk identifies the type of data:
```

"ILBM" = interleaved bit map
"8SVX" = 8-bit sample voice
"SMUS" = simple music score
"FTXT" = formatted text (Amiga)

<MacPaint> *.MAC

1 long version number [0=ignore header, 2=header valid]
38 * 8 bytes 8x8 brush/fill patterns. Each byte is a pattern row,
and the bytes map the pattern rows top to bottom. The
patterns are stored in the order they appear at the bottom
of the MacPaint screen top to bottom, left to right.
204 bytes unused
----
512 bytes total for header

< 51200 bytes compressed bitmap data

< 51712 bytes total

NOTE: The version number is actually a flag to MacPaint to indicate if
the brush/fill patterns are present in the file. If the version is 0,
the default patterns are used. Therefore you can simply save a MacPaint
file by writing a blank header (512 $00 bytes), followed by the packed
image data.

Bitmap compression:

The bitmap data is for a 576 pixel by 720 pixel monochrome image.
The packing method is PackBits (see below). There are 72 bytes per
scan line. Each bit represents one pixel; 0 = white, 1 = black.

<PackBits Compression Algorithm>

The following packing algorithm originated on the Mac, was adopted by
Electronic Arts/Commodore for use in the IFF standard, and then by Tom
Hudson for use in DEGAS Elite. The algorithm is currently used in
MacPaint, IFF, and DEGAS Elite compressed file formats. Each scan line
is packed separately, and packing never extends beyond a scan line.

For a given control byte 'n':
0 <= n <= 127 : use the next n + 1 bytes literally (no repetition).
-127 <= n <= -1 : use the next byte -n + 1 times.
n = -128 : no operation, not used.

---

Source record: 238339

I know this was discussed some time ago, but I don't have the articles any more.

What is the status on programs to produce ST-readable (2-sided) floppies on a SPARCstation, either fixes to the Sun programs or new ones would do.

I seem to remember colas@avahi.inria.fr (Colas Nahaboo) had something along these lines, how are things coming along?

|If MiNT is in the public domain, wouldn't it be nice (!) if there was a
|multi-tasking C shell (as there is for Micro RTX) for it... and if that were
|also public domain (with full sources), wouldn't THAT be nice :-)
|
|Anyone want to write it? :-)

Well, I use a shell that I wrote myself several (3?) years ago. This is a Bourne type shell with command recall hacked in; it also can 'preload' programs (I typically preload 'ls' and 'pwd' for speed), sort of a substitute for builtin functions, but with greater flexibility and keeping the shell itself small.

There are some problems with quoting still that I didn't care to solve; but this would be a challenge for a devoted programmer. I'd probably write different (better?) code now, but it would be a good starting point. The code contains the hooks and pointers for multi-tasking, without actually implementing it (or implementing by resorting to temporary files). Probably a piece of cake to convert for MiNT or RTX (it should support both if possible).

Add job control and aliases and you get a G (gee) shell 8-).

What should I best do with it? Mail to selected individuals, or send to the sources moderator? I probably can't do it myself, having too little time to undertake yet another project. Feedback appreciated.

Leo.

>When I have time, I'll try to port the MinT sources to TC.
>

An excellent idea. I have heard that TC produces _much_ faster code than
any other compiler, and that the speed difference is almost like a chip
upgrade. Also, TC's code is supposed to be about 1/3 smaller than other
compilers. MiNT would probably be blindingly fast compiled with TC.

Joep,
Onder Spectre kun je partities gebruiken die groter zijn dan de max.
16 Meg die onder ST-mode is toegestaan. In principe oneindig, of in
elke geval ergens richting 64 Meg.
Je kunt bijv. formtteren met AHDI van Atari, maar ook met Supra of ICD
formatters.Ik meen dat supra tot max 32 meg per partitie gaat.

Staat trouwens gewoon in de handeleiding, pag. 94 ev.

HARD DISK SENTRY is the Beckemeyer Development commercial
hard disk analysis, repair, and optimzer (de-fragger).
It is reliable and it works with large (e.g HDX 3.x)
partitions. The retail price is $49.95.

HD SENTRY also includes a low-level disk sector test program
which will check disks for sector errors and optionally
mark them bad in the FATs.

> Another possibility is a GNUware program I got off the net, called
> dld, a dynamic loader.
>

A version of dld for gcc is on cs.uni-sb.de in dir /pub/atari/gcc/binutils. The archive dld-3-2.zoo contains the dynamic loader package (source). The complete library for linking/unlinking and findinng symbols is < 20 kB when compiled by gcc 1.37. To use the package you need GNU-object files (these are produced by gcc or Laser C) and you have to link your executable with the new ld (in dir /pub/atari/bin) to produce a TOS executable with dbx-symbols. You should also get the binary for GNU-strip to strip local symbols from the objects you which to link dynamically.
Before i forget it: this is a beta test version according to Wilson Ho who wrote the unix-version!

> What is the best flight sim program for the ST. Does Sublogic support the
> st with their flight Simulators?

Definitely Flight Simulator II, from SubLogic. Consider this an unequivocal endorsement. And if you get tired of FS2, then buy Jet from them.

SubLogic also has scenery disks to go with FSII and Jet. Awesome. To really get into it, find a copy of Charles Gulick's "Flying Flight Simulator," and set it in your lap while you "play." (Hey, man, this ain't no game!)

> Also where would I go about getting
> software to emulate the PC?

Stay away from PC Ditto II. The mfr. went bankrupt. Try PC Speed, or ??? the other one. I don't have sources. (BTW, our PC Ditto II worked fine, once we got it working. But what a pain to get to that point!)

> And hardware or software to emulate the mac?

Definitely Spectre GCR, from Gadgets By Small, 40 W. Littleton Blvd., Littleton, Colorado. (303)791-6098. You have to obtain the Mac ROMs separately. Spectre is an elegant hack. I giggle with delight every time I fire mine up. GBSmall is a terrific little company, and I wish them all the success in the world. (They need all the luck they can get, now that Big Green Apple is trying to shut down the ROM pipeline. Buy your ROMs *NOW*!)

> and how good are these emulations.

Spectre GCR is fantastic, see my gushing above. Liek I said, PC Ditto II worked fine, but it was a bear to get going, and doesn't fit very well in our classic 1040ST case. I have no experience with the other emulators.

Spectre GCR lets you read/write Mac floppies directly in the ST. It also lets you use hard disks and printers. You need a monochrome monitor, though, and a copy of MacPrint if you're going to use a DeskJet, LaserJet or non-Apple printer. DeskWriter works fine.

> and lastly where would I go to find
> a fairly priced modem for the ST?

Sorry, I haven't bought one yet. Most people buy the Supra 2400-baud modem from Supra Corp, Albany, Oregon. Supra also sells HD's for the ST.

Check your local dealers, or mail-order houses for the best prices.
Good luck, and have fun with your machine.

spectre will use any partition on any hard drive.
(There is some folk lore on the position (0 1 2 3 etc.
Use the last one on your hard disk).

Your favorite partition program may make them all TOS. Don't
worry, Spectre will redo it its own way.

One thing to remember. Most of the formatters assume the partitioner will
map out bad sectors. Spectre (ala MAC) will not do this. If your partition
has bad sectors in it bad things will happen later if its in specter format.

(I solved this for controllers using the Adaptec 4000 and 4070 by writing my
own formatter, and giving the adaptec the bad sector list. It maps them out
at the lowest level, leaving the partitions error free.).

No the auto folder should not affect this.

PCDitto require that both C: and D: have valid IBM headers. TOS doesn't care if the IBM header is there or not. The D: thing is curious but its how I experienced it, and after disassembling the code, read it that way. Its a bug; now a feature!.

Also, for the C: to boot the IBMCOM and BIOS files must be the first in the FAT and Directory. If your resorter for the Auto folder or G+ muck arround with the order of these files you won't boot either.

2237. WAACE AtariFest 90 Organisations List

Newsgroup: comp.sys.atari.st
Date: 1990-09-28 20:29:12 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1990Sep28.202912.5220@terminator.cc.umich.edu>
Source record: 238253

Howdy,
I'm postin this for John Barnes. It is an updated list of participating organizations for Atarifest '90. The Atari.Archive posse will be there, so should you....Please mail John directly for details, NOT ME, as I don't know.

Thanks,
weiner

The following Organizations are participating in WAACE ATariFest '90 as paid exhibitors:

Advanced Technology Networks Alpha Systems
Application & Design Software Atari Corp (US)
Authorware Best Electronics
Branch Always Software Codehead Software
Computer Digest Current Notes, Inc.
D. A. Brumleve Data Innovations, Inc.
Debonair Software Double Click Software
Dr. BobWare FAST Technology
Frontier Software Gadgets By Small
GEnie Goldleaf Publishing, Inc.
Gribnif Software ICD
ISD Marketing, Inc. Joppa Computer Products
L & Y Electronics MacDonald Associates
Michtron, Inc. MultiByte
SLICCware Step Ahead Software, Inc.
Taylor Ridge Books Toad Computers
Washington Music Center WizWorks!
Zubair Interfaces, Inc.

These 35 organizations are a cross section of all that is best in the Atari Community. Please download this message and post it on any bulletin boards that you are connected to. Please pass it on to your user group officers and urge them to pass the word to all members.

WAACE AtariFest '90 is the only Atari show on the East Coast this year that is receiving full Atari corporation support.

For further information contact:

J.D.BARNES (GEnie)
JDBARNES (Delphi)
JOHNBARNES@ENH.NIST.GOV (Internet)

This version (23 Sept 1990) of the list is a correction of an earlier posting (22 Sept 1990). I regret the errors which caused a couple of

vendors to be omitted.

2239. UNITERM Question

Newsgroup: comp.sys.atari.st
Date: 1990-09-28 23:52:59 UTC
From: kethorpe@violet.uwaterloo.ca
Message-ID: <1990Sep28.235259.24143@watdragon.waterloo.edu>
Source record: 238259

I've recently begun using UNITERM and I have a couple of questions.

When I start it up it always gives me an error per restoring my setup.
What should the name of the setup file be to load automatically when I
start? I tried DEFAULT.SET but to no avail.

Secondly, is there a way to have a set of phone numbers load
automatically as well?

Unfortunately, when the computer and UNITERM was given to me, there
was no documentation for me to look this up myself.

Thanks in advance
Kevin

2240. VCR backup units [request for info]

Newsgroup: comp.sys.atari.st
Date: 1990-09-29 00:03:05 UTC
From: pesch@pa.reuter.COM
Message-ID: <423@saxony.pa.reuter.COM>
Source record: 238268

Last time I dropped in to see my local ST dealer, he had something that caught my eye: a VCR-based tape backup adapter and software kit for the ST. Apparently the thing is called "DVT VCR", and is by some outfit called "Seymour/Radix". The price seems reasonable---$99---but according to the dealer, it won't do any sort of good to my Spectre partitions; it doesn't even have an image backup mode.

Now, I've been wishing for some kind of tape backup, and at that price I'd love to go for the thing. But I've got a lot of stuff under Spectre, and may at some point start keeping a lot of stuff under something like Minix---another non-TOS partition or two.

Anywho: (1) has anyone got experience with this, or any other, VCR backup device for the ST?
(2) Can it really not deal with non-TOS partitions? Does this apply to its competition as well, if it has any?
(3) Any general thoughts on robustness of VHS tape as a backup medium---how reliable is it (do I need to make three copies of everything because of expecting two to fail?), how long do the tapes last, anything else that seems useful?

Thanks!
/Roland

MiNT is intended to support all TOS system calls. Does GFA-Basic use some undocumented system calls? Or is there some other reason that GFA-Basic written programs are not usable under MiNT? (If the problem is MiNT, of course, that can be fixed.)

2246. New disk drive, more troubles...

Newsgroup: comp.sys.atari.st
Date: 1990-09-29 07:38:22 UTC
From: jamesl@CIE.UOREGON.EDU
Message-ID: <9009290738.AA02602@cie.uoregon.edu>
Source record: 238271

Hi. I'd like to thank everybody who sent me sugestions and information on my disk drive problems. In short, the drive was scrambling files at random opn my disks. My final solution was to trade in for a new built-in drive at my local Atari dealer. End of problem, right? I'm not so sure...

My new disk drive is still having problems with disks, but they're not the same problems. Some disks are now unreadable, and cannot be formatted. How is it possible for a disk drive to damage a disk this way?

Some files are damaged in such a way that I can copy them from drive to a ramdisk, but only part of the file gets copied. One file I copied six times, and each time got a different byte count on my destination drive (the ramdisk). Yet, the computer carried out the copy as if everything was fine with no error messages, which has never happened to me before.

A couple disks which have *never* been placed in my old drive without write protection now have damaged files. I've lost all of my copies of Interlink this way. Could my old drive have damaged a write-protected disk?

Finally, I used the check disk feature of Hypercopy on some of these suspect disks, and, when I can get past the "Disk A: may be damaged" error flag, am told that these disks have damaged FAT sectors.

I have a couple of questions that I hope somebody out there has the time to answer...

Could a disk with defective heads have caused all this damage? Or might the new disk be having problems?

Could the problem reside, not in the disk itself, but in one of the chips controlling the disk I/O? Once the chips in the case worked loose and I had to open it up and physically push them back down (don't worry, I was grounded) before the computer wopuld recognize the disk drive.

Are there any programs in the FTP sites that would give me a detailed examination of my disks and tell me what is wrong? If it's damage from the old drive, I'd like to isolate the bad disks so I may deal with them.

Anyway, thanks again for taking the time to listen to me, and I hope somebody knows something that might help me get a handle on this %$#*!! problem...

The name is UNITERM.SET ...

>Secondly, is there a way to have a set of phone numbers load
>automatically as well?
Sure, use the menu 'Other/Dialer ...', enter your numbers and modem characteristics, and select 'Save numbers' from the File menu. The file's name here is UNITERM.TEL. It laods automatically on startup.
When you press the right mouse button, you get a popup menu where you can select a phone number with one mouse click ...

2252. Wanted: X-Window Server

Newsgroup: comp.sys.atari.st
Date: 1990-09-29 13:47:00 UTC
From: jan@swi.psy.uva.nl
Message-ID: <4406@swi.swi.psy.uva.nl>
Source record: 238270

I'm wondering whether there is an implementation for an X-server that runs on an Atari (Mega)-ST. I regulary use my Atari to connect to a Unix machine and I have the impression that it should be possible to do this via X.

NCD X-Terminals can run X while communicating via a serial port and they claim that even on low baudrates (about 4800) the performance is acceptable. The NCD terminal has similar hardware than the Atari Mega-ST (certainly when we consider the screen of the NCD terminals is over 1000x1000 pixels), so I presume it is possible to implement an acceptable server on an atari. A search on the archive servers for both atari software and X software did not provide me with any clues.

Anyone who knows about something going on in this direction?

Please reply via mail as I'm an irregular reader of News an the expire time is VERY short.

Thanks --- Jan

2253. SYSMON

Newsgroup: comp.sys.atari.st
Date: 1990-09-29 15:54:53 UTC
From: entropy@mole.ai.mit.edu
Message-ID: <ENTROPY.90Sep29115453@mole.ai.mit.edu>
Source record: 238266

I downloaded SYSMON from the site in germany someone mentioned. It unpacked fine but the executable gives 2 bombs when I run it. Can't figure out what's wrong, as the docs are in German. Does it require TOS 1.4?

2254. How can I find current DTA address w/o using TRAP #1?

Newsgroup: comp.sys.atari.st
Date: 1990-09-29 20:59:53 UTC
From: ADAM_TILGHMAN@bdt.UUCP
Message-ID: <5429@bdt.UUCP>
Source record: 238277

I am in the middle of a project and have come upon an obstacle... I am using an external PD program, but in order to get it to do what I want I need to trap all FSFIRST/FSNEXT calls (in order to substitute my own filenames), as well as FOPEN() calls (to change the filename to suit my needs). So far I have this working perfectly EXCEPT for the fact that I can't find the current DTA address; is there any way that I can do this while processing a TRAP #1?

Adam Tilghman

P.S. - Please post replies to the net - my email feed is shaky

>
>I think it is unecessary. Most games are the same on the amiga and the atari,
>so we can share the same newsgroup (which I do).

Well I could care less if amiga has a games base let them stay on there

bases and we can enjoy a new atari message base for games!

It is necessary for three reasons. One I have source files in C,GFA, and
Stos that support game programming! Two there are far more Atari games
than there are Amiga games(Now Amiga owners dont get huffy,we have been
around longer!) Three most Atari games are unique and have no amiga equivalent!

Put another vote in for me for a new Atari Games Base!
I have hundreds of PD games for the Atari with no equivalent on other machines,this is
mainly due to STOS being out longer than Amos.

Hardware Dave putting the 100 vote on this so why isnt somebody doing
something about it. At least over a 3 month period we can get this going.
Already the comp.sys.atari.tech base has grown rapidly.

I did the same thing, and it works for me. I do have TOS 1.4. The docs contain a long list of TOS versions which it knows about. I think you will need to read the docs. There is a lot to learn about the program that would be hard to figure out by just playing with it. You should also be aware that it is shareware and what the shareware conditions are.

>and set a global variable _mint to TRUE or FALSE (and do the
>same for _rtx, of course). Then the library can use these
>variables to decide how to execute system functions.

Not much sooner said than done; I just sent the modified source code for the GCC library to atari.archive (the file is called mintlib.zoo; check for it in the newitems directory, it should be there soon). The library is optimized for MiNT, in the sense that I didn't bother trying to emulate things like fork() and vfork() under TOS (as in previous versions of the library, there's a spawnve() call to emulate fork/exec/wait in TOS; under MiNT you can also use spawnve() to start things in the background). The external variable __mint is set to the MiNT version we're running under, or 0 for TOS.
This library can compile the Sun version of bash with 0 changes (well, if you're doing it on an ST instead of a Sun you'll have to rename "y.tab.c" and "y.tab.h" to "y,tab.c" and "y,tab.h", or whatever the names are that your Yacc clone outputs). This is not to say that bash has been ported to MiNT. The path code should be changed to accept commas instead of colons, and the startup file names should be modified (to "bash.pro" instead of ".bash-profile", etc.); and it would be nice to be able to type "ls" instead of ls.ttp. I hope someone can do this polishing; I haven't got a whole lot of time.
I don't know RTX well enough to try to write a library for it; also, my primary interest is in compiling Unix (BSD flavor) software, and MiNT is (by design) better suited to this than RTX. (Conversely, RTX is better at lightweight processes than MiNT is; a cthreads library for RTX would be almost trivial). So the MiNT library doesn't support RTX at all. Since everything is in source form, you can add this support if you want. It would probably be worthwhile, since lots of people use RTX.

>its how I experienced it, and after disassembling the code, read it that
>way. Its a bug; now a feature!.
Does this mean I have to format D: (as well as C:) with dos?
I thought the manual specifically said you didn't have to do
this. Besides, before messing around with the AUTO
folder, both C: and D: worked fine with dos...AND C: booted
from dos.
>Also, for the C: to boot the IBMCOM and BIOS files must be the first in
>the FAT and Directory. If your resorter for the Auto folder or G+
>muck arround with the order of these files you won't boot either.
Well, I presume that something must have been messing around
with the placement of IBMCOM and BIOS files! My question now
is: Is there some way to get IBMCOM and the BIOS files back
into their first position without going through the whole
formatting procedure all over again? I'm keeping my fingers
crosses that there is...and that it is easy!

>>Also: SLC's can be had for less than $3.5k - shop around. Bluntly, no
>
>Where over here in Europe can I get it? I know a few people, including me,
>who'd then buy them for X terminals and such.

Actually, whoever wrote the original article wasn't that far off, with
academic rebate you can get a SLC for about ~$4000 in Switzerland and
an IPC with 200MB disk for about ~$9000. As far as I know there is no
similar rebate for Atari's here. (Not that I think it's a fair
comparison anyway, you get a lot more for your money when you go out
and buy a Sun.)

Anyway the main problem with the TT (except Atari per se) is price:
it's nearly twice as expensive as what I payed a long time ago (can
it be five years? how time flys) for my ST520. If you ask around, most
people wont go out and buy a computer for personal use that is way over
SFr. 3000.-/$2300. So it really only appeals to freaks (considering the
age group a lot of european Atari hackers are in, I have a lot of problems
imagining them forking out this kind of money), businesses and academic
institutions. While I can't speak for the couple of businesses that use
Atari's in Switzerland, I do know that they don't have any chance of
selling any substantial ammounts into the academic market (at least not
at the current price).

[BTW does anbody know why Atari actually decided to release the TT?
Sinking ST sales?]

Actually, you are not limited to manufacturers that make things only for the ST. Just buy what you think is the best quality modem at your price range, because almost any external modem which attaches to an RS-232 port will work. The same idea also applies for printers. (The only caveats I know of are mentioned in the discussion on the HP DeskJet's.)

I don't know about Rodines, but Spectre GCR works fine with my Supra,
which contains a Quantum 80 Mb HD. I have two 16 Mb Mac partitions on
the disk. Earlier I had one partition on a Supra 60, that worked fine too.

>work on my sparc 1+ to read and write 3.5" 720k disks for my PC.
>Clarence Wilkerson

Well, I have applied ALL necessary patches as well as received two binaries from a friend over the network, but I have yet to have a sparcstation format a 3.5" disk and have my 1040st (TOS1.0) read the disk without scrambling the data.

I have tried formatting disks on the ST and the sparcstation and neither seems to make a difference. Next, I have yet to try to format a disk on a REAL IBM (clone! :-)) but I don't think that will make a difference.

If someone actually has this type of system working for them, I would LOVE to test your methods! Would you send me your binaries and the EXACT steps you use to read the disks?

I think it's all a myth! It can't be done...
[That ought to do it!]

Ok, I need to get the Neodesk 3.0 upgrade. I got their little flyer, and I said, "Neat, I think I'll get this. I've been waiting for this for a while." So I proceed to fill the thing out. Then I set it down. Later, I decide, "Hey, it's time to write the check for this, and send it out." Now I can't find the flyer. Where and how much money do I need to send? I have NeoDesk version 2.05.

thankx....

2277. Monitor/TV setup

Newsgroup: comp.sys.atari.st
Date: 1990-10-01 10:27:56 UTC
From: csual@warwick.ac.uk
Message-ID: <1990Oct1.102756.27665@warwick.ac.uk>
Source record: 238202

I've asked this question before on comp.sys.atari.st but got no useful
replies - Hopefully you guyz know what you're on about!
I've got a mono monitor for any serious work and a simple old colour TV for
colour(i.e.games). The TV is connected via the aerial socket (no SCART socket)
and the monitor by the monitor port.
The problem is that if the monitor is plugged in the back the machine always
boots into high res, even if the monitor is switched off. This means that I
have to unplug the monitor whenever I want to use the TV.
Is there any known fix for this? I don't mind a bit of soldering in the back
of the ST but an external solution is preferred. I'm running an STe with
2Mb RAM.
Answers on the back of a postcard to:

csual@uk.ac.warwick.cu

Cheers,
Jas.

>I can't find the current DTA address; is there any way that I can
>do this while processing a TRAP #1?
Experience tells me that you can call a GEMDOS function in your own
trap #1 handler _before_ executing the actual function desired by the
user or OS. So build a trap handler, analyse what you get on the
stack (beware of the difference between 68000 and 68010/20/30/40),
then call Fgetdta (save those registers!), then call the desired
function. Worked for me, but I don't know if this is a documented
feature, so please don't blame me if it won't work. It just seems
logical if you look at the way the GEMDOS trap handler works.

Do you _really_ need to know things like that? Another method comes
to my mind: If you're linked into the GEMDOS trap you can also
follow any manipulation of the current DTA address by tracing
Fsetdta calls (watch out for those Pexec calls that place the
default DTA into the basepage). Sounds much cleaner to me, but then,
this method assumes that DTA addresses are only changed by Fsetdta
and Pexec calls and that GEMDOS doesn't change them internally.

Good luck,

CB

^^^^^^^^^^^^

I don't want to flame here, but there are a few MAJOR problems with
this.

1) You cannot emulate the Amiga video modes in software
2) You cannot stop direct access to amiga chips (done EVERYWHERE in
the operating system and software) without special hardware to
map access to software emulation which would be very difficult
anyway.
3) DMA and the sound would be hard (impossible?) to trap in software

Does anyone know of an object orientated drawing program for the ST that is PD or shareware?

Anything that can produce .GEM files would be useful as I can't afford Easy-Draw or Hyper-Draw. Is there such a program in PD?

Richard

2283. The TT is actually nice

Newsgroup: comp.sys.atari.st
Date: 1990-10-01 12:55:57 UTC
From: t68@nikhefh.nikhef.nl
Message-ID: <1007@nikhefh.nikhef.nl>
Source record: 238205

With all the ongoing bickering about Atari policy I think
it is about time that someone should mention that the TT is
actually quite a nice machine.
At the moment I have at home a TT with:
32 Mhz 68030
32 Mhz 68882
4 Mbytes ST RAM
4 Mbytes TT RAM
48 Mbytes 28msec hard disk
VGA monitor (640 by 480 pixels with 4 color planes).
So of course I had to test its performance and the like.
It turns out that the performance seems to be disappointing
till you tune it the same way many people got their ST tuned
with cachexxx.prg and/or similar programs.
The speed is very much a function of what memory you use, as
can be seen in the table:

On Mega 4: 249 sec
ST/RAM 68030 Cache off 146 sec
TT/RAM 68030 Cache off 86 sec
ST/RAM 68030 Cache on 80 sec
TT/RAM 68030 Cache on 55.5 sec
TT/RAM 68030 Cache on 68020 code 51.4 sec

The above was a FORM test program. Typical runs give about a
factor 4. I measured the same kind of speed increase for the
turbo C compiler. After turning on the appropriate bits in
the program header to force the compiler to run in the TT RAM
the speed increase was more than a factor 4.
MetaFont runs faster by a factor 8. Apparently it uses many
shifts and bitfields.

Of course many programs don't run on it, but it is possible to
switch to ST mode (choice of all three resolutions). The main
problem for me is that the Turbo-C compiler doesn't support
the 68020 modes convincingly. Especially when long multiplications
divisions and mod operations are involved it may loose track
of what it is doing. It is also necessary to use a new
floating point library. The 68882 operations are produced inline,
but the trancendental functions are done by a call to a function.
The speed is nice. I measured a Savage test time of 0.1597 sec.
Most libraries of the compilers take on the 68000 (if they are
very fast) in double precision more than 30 sec. The chip
can do 600000 80 bit multiplications per second. This means that
finally it is possible to do some serious calculations at home.

Now something about the price. There is a price range for which this computer seems to be a good buy. This would be the range around 8000 dutch guilders (or less of course). In Holland a SUN with proper disks etc would cost close to 15000 and an Apollo DN2500 with disk would be more than 10000 after discount. Actually the DN2500 is slower. It runs on 20 Mhz. The DN3500 from which I type this in runs on 25 Mhz and runs the same program as tested above in 56 sec with code that was produced for the 68020/68030 and its disks are faster. In addition the 56 sec are CPU time.
If on the other the machine starts costing more than 10000 guilders it may be too expensive to be attractive. The official price is actually slightly above 10000 guilders, so there may be a problem there. For reference: A fully equipped Mac II cx etc costs here after discount also about 15000 guilders.

I have also seen an ethernet card for the Mega and there will be one shortly for the TT too. Atari is mainly waiting on this TT version of the card before they come out with it. It seems the better policy. The price would be very reasonable.

Talking about policy:
First Atari talks much about new products that never make it to the market or if they make it have generated such an expectations that the actual product is disappointing or too late or whatever. Then we hardly hear anything from them for nearly two years and everyone thinks the ST is their last good product. Then the TT comes out, showing that they can still do something.
I believe this last mode of operation wasn't entirely ideal either, because they must have lost the faith of many people. Somehow it seems to me that the proper policy should be inbetween. This could be expressed by a better (software) policy.
Many developers have felt in the past that Atari left them out in the cold. Of course Atari isn't a social institute, but somehow I have a feeling that this could be beneficial to both sides.
One such act could be to see what is needed to get Simon Poole to make uniterm run on the TT. This program alone made Atari sell many ST computers in Germany and in Holland.

Jos Vermaseren

Disclaimer:
I my employer would have a faster computer he could reject my opinions much faster.

Actually, about a week ago I asked a friend at MIT to check the price
for me (Columbia has no program for students to buy Suns) and he told
me the student rate was ~$3250. Add in about $1K for a 300meg SCSI
hard disk and VIOLA, a nice little "roll your own" unix system with
an industry standard OS (SunOS 4.1).
>
>Actually, whoever wrote the original article wasn't that far off, with

>similar rebate for Atari's here. (Not that I think it's a fair
>comparison anyway, you get a lot more for your money when you go out
>and buy a Sun.)

I must agree. I think you'd be hard pressed to find anyone who would
buy any Atari product over a comparable (in this case better) Sun
product given reasonably close prices (within $1-2K).

>
>Anyway the main problem with the TT (except Atari per se) is price:
>it's nearly twice as expensive as what I payed a long time ago (can
>it be five years? how time flys) for my ST520. If you ask around, most

Well, I'm not sure how fair it is to compare prices of a 5 year old
68000 system and a new 68030 system. That might be a bit of a stretch.

>age group a lot of european Atari hackers are in, I have a lot of problems
>imagining them forking out this kind of money), businesses and academic
>institutions. While I can't speak for the couple of businesses that use
>Atari's in Switzerland, I do know that they don't have any chance of
>selling any substantial ammounts into the academic market (at least not
>at the current price).

Again, I think you are right. I personally don't see a market for
this machine (unless it was pretty cheap) anywhere (US or Europe).
Anyone who wants a decent unix environment is going to buy from more
respected manufacturers at prices not much above Atari's. As far
as it being marketed as a "turboST", that would work just fine
given appropriate pricing.

>[BTW does anbody know why Atari actually decided to release the TT?
>Sinking ST sales?]

I would be curious to know why also. Maybe they thought that they would
have had more market penetration by now? The TT would make a lot more
sense if Atari had another million or so STs out there.

Source record: 238206

In article <5429@bdt.UUCP> ADAM_TILGHMAN@bdt.UUCP writes:

> I can't find the current DTA address; is there any way that I can
> do this while processing a TRAP #1?

The current process' DTA address is recorded in the basepage which can
be derived from the act_pd system variable (this in turn is recorded
in the sys_base (the first few bytes after the ROM-start) for TOS
versions >= 1.2).

BTW.:
You should be able to call trap #1 recursively if you do it inline
(for example in assembler) and avoid library routines that save the
return address in a static memory location. The shell that i am using
(Master) calls trap #1 very often in this way (even from inside a
bios-trap --- but that's another story).

Hope this helps!

>I can't find the current DTA address; is there any way that I can
>do this while processing a TRAP #1?

Since you're intercepting trap 1 calls, this should be cake. Trap 1 is not inherently non-reentrant, it's GEMDOS that makes it so. Your code could make a "real" trap 1 call into GEMDOS for the Fgetdta call.

Making a "real" trap 1 call can be done two ways: either you replace the old trap 1 vector, make your call, then write yours in again, or your "fake" the trap 1 by creating a stack frame and jumping to the old vector.

Any time you catch GEMDOS or BIOS traps, or create a trap or interrupt stack frame, you should be sure to check the system variable "longframe" at $59e (word). If it's nonzero, you are on a machine with "long frames" -- an extra word on the stack after the SR and PC. Only the 68000 has short frames; every other 680x0 has long frames.

I am answering this in such detail because I want to forestall somebody else pointing out that you can look in the current process' basepage for its current DTA pointer. This is not a published fact, and therefore the location and meaning of that variable is subject to change.

>...and all that available with the full sourcecode.
>I mean, isn't that worth thinking about?
>

I guess it's worth thinking about. I see that it would benifit the
ST community, at least in the short term, but in what way does it beneift
me or Beckemeyer Development? Is the ST market so poor that the only
course for ST developers is to give their software away? You may work
in your spare time to develop for the ST, and there's nothing wrong
with that, but I have a company that is supposedly in the ST business
to profit and stay in business. I mean if you're saying that I have
to give everything away, then why should I stay in the Atari "business"?
I guess you're suggesting that I should switch to a part-time "spare-time"
ST programmer and quit the ST "for-profit" business. That's practically
what I'm doing now. I mean I wouldn't be in business if all I did was
sell ST wares. The thing is that as a professional company I can at
least afford to run a BBS, print real manuals, and do real updates
to software (like all the work I'm in the middle of in updating
MT C-Shell and other S/W and to add a bunch of TT030 support including
an all-new version of RTX). If I completely go "shareware" (which is
pretty darned close to free-ware in this business), I would not be
able to offer any of the support that we now offer. Does it really
benefit the ST community more to tell the software companies to
give their software away and get out the ST business, in your opinion?

I mean with BDT products and various PD/Free-ware options, I already have
all the things you list, and more:

- Multitasking (RTX)
- A window-System (GEM with the MT C-Shell Visual Shell)
- Usenet connection with Mail and News (MT C-Shell UUCP and Bootstrap News)

- A Unix-Cshell (MT C-Shell).
- Unix-like libraries (MT C-Shell Software Dev. System).
- GEM application compatibility
- Installable device drivers
- Drivers for up to 12 serial ports (DC-Port, BayTech MUX etc.)
- Custom applications (multiuser retail point-of-sale, etc.)
- TT030 support

>ST-Users and -programers, unite and work together! :-)

I am trying to work together. I have released the Micro RTX kernel along with the complete documentation as shareware. I have offered to help anybody develop RTX based applications, including a GEM extension to it or a shell.

I'm not saying I can't be convinced that releasing Micro C-Shell as "share-ware" or something is a good idea, I'm just saying that I need more convincing. I mean I did release Micro RTX as shareware based mostly on the arguments from several net.people explaining the fantastic benefits of doing so. Of course these benefits have yet to be realized, but such is life.

Well I just wanted to make a quick note that my LaserJet 3 works fine it I turn it on after my Mega. Usually it takes me quite awhile to get a page just right to print so if I had to keep my printer on until I was ready to print, it would be very annoying to say the least (especially with New England summers :-(I'll also ad that I barely notice the LJ's sound, a very quiet machine!

(Side Note to Ray: I was really suprised to hear the DJ came out of Corvallis (or Cowvalley as we used to call it.) I had friends who used to work at the Corvallis HP but I don't think they worked on the DJ. OSU, born to be bad at football! :-)

Ok, I have tried to use Turtle now many times. I have booted up off a floppy with a special modified ICD driver with all cache's off and all set to a minimum to save memory. When I run turtle, it sets up the ramdisk, but every once in a while the program says something like "turtle.ttp cannot open file on drive xx" where xx is the ramdisk letter (I think M). The program stops, and when I return to the desktop, all the files that were backed up are hidden or something...I have to shutdown and wait for a bit, then I can turn my system back on and the files are back.

I have a 1 meg 1040 st, ICD host adaptor and using the ICD driver.

Has anyone else seen this problem and knows what to do?

>
I have started my ST system from the surge protector almost since I had it, but I have had some strange feeling that it wasn't good for the computer, so I had the monitor and printer turn on that way, and turned the computer on manually.

Now that I have a hard disk, I have the monitor, modem, and hard drive turn on with the surge protector, but this is because the HD has to get up to speed before I can turn on the ST. I don't have the printer come on because they zap a lot of electricity, so I leave it off until I need it.

At the time I bought my ST, you could just barely get a basic 286 system without hard disk for the amount of money the ST costed, now I could get a reasonable 386 system for the same (I doubt if any x86 system is reasonable anyway :-)). Why shouldn't Atari customers expect a similar advance in bang for the buck?

2306. MGR running under MiNT

Newsgroup: comp.sys.atari.st
Date: 1990-10-01 22:54:15 UTC
From: 7103_2622@uwovax.uwo.ca
Message-ID: <7221.270790d7@uwovax.uwo.ca>
Source record: 238210

A version of MGR for the Atari ST is now available for anonymous FTP from flash.bellcore.com (directory pub/mgr/ATARI) and atari.archive.umich.edu (I don't know what directory -- try newitems). The patches (only) to the Sparc MGR source code are included, and have also been sent to the moderator of comp.sources.atari.st. This version of MGR requires at least a megabyte (it'll probably not run very well in such limited memory), and the MiNT multitasking system.

MGR is a networked window system, similar in some ways to the X window system but much simpler (and smaller). You can have multiple processes running in different windows on the screen. Each window can have 2 different menus attached to it, and processes can specify actions to be taken when events occur (such as a mouse button press, window being covered/uncovered, menu selection, or window resize request). In many respects, MGR is similar to GEM, but it has a very different look and feel (menus pop up at the current mouse cursor position, for example) and it is *not* GEM compatible; running GEM programs in an MGR window will at best produce confusion, and at worst will crash the system. (I think it would be possible to write a GEM emulator to translate AES/VDI calls into MGR escape sequences; I invite interested programmers to give this a try -- the payoff would be multitasking, network capable GEM).

Ordinary TOS programs that know about TERM and TERMCAP can run in MGR windows without change. Unfortunately, most TOS programs (including gulam) have VT52 escape codes hard wired in. A vt52 terminal emulator is included to allow these programs to run, but they will be slowed down. Also, it isn't possible to set up an 80x25 window on a medium resolution screen with the supplied fonts (on a monochrome screen there's room to spare).

Included in the atarimgr.zoo file are the mgr executable, source code for the MGR library, some sample fonts and icons, and a few demo programs. An accompanying file (called mgrdemos.zoo or ataridemos.zoo, depending on where you find it) contains many more demo programs, and some more icons. Even more fonts and icons, and the original source code relative to which the atari patches were made, may be found in the file sparcmgr.tar.Z on flash.bellcore.com.

As mentioned above, MGR requires at least 1 megabyte (2 or more is highly recommended) and MiNT. It works in any resolution, but all output is in black and white (color MGR is possible, I just haven't tried it yet). Output to/from the screen is done with line A calls, so it *should* work with unusual (i.e. large) screens; with a program like MGR, the bigger the screen the better. I would *not* recommend it for use in low resolution.

MGR is copyright Bellcore (Bell Communications Research). It may be distributed freely, but may not be sold for profit. The author is Steven

A. Uhler; he's done a very nice job.

Hi!

Have your heard about the new Atari slogan, to be used with the
introduction of the TT?

Power has its Price!

By the way: Atari is currently selling 3 different ST models with 1 Mb
of memory around here: The 1040, the Mega 1 and the 1040 STe.
Price difference between them is some $ 150,--, the 1040 being the
cheepest.

Cheers,

>Anyone want to translate them?

HI,

Karsten Isakovic, the Author of SYS_MON will post the english Version
in the next week. The old Version 1.0.4 only works with German issues
of the ATARI TOS. The new Version, which has not been accessable for the public
will work with all TOS VER's. Keep in touch.....you will be surprised,
what this program can do for you.

Bye...Michael

|Video Production Major ||| [THIS SPACE AVAILABLE]
|California State University, Chico / | \ [LEAVE E-MAIL]

This seems rather surprising behaviour; it would annoy me as a user.
The Suntools solution seems nicer: a key is reserved that tops each window consecutively; alternatively you can click on a window's border to expose that particular window to the top. Clicking on a window will make it current (but no top it). This can easily be put into a program, or even hacked into the mouse driver (making it more generic). The unability of GEM to work with other windows than the top one, or to top hidden windows is rather a drawback.

Leo.

Sorry to put a dialog here, but it has general application!

> How did you do that? I always thought the Adaptec controller couldn't do
> that because of a firmware bug - is there a trick?
>

I have never heard of an Adaptec problem. I have 2 Adaptec 4000A and the
Atari clone (in a SH204). All of them properly accept the bad bit map
(could be called bad sector list) and map them out perfectly. I know they
are doing it right because I have drives that completely died using the old HDX
and that is why I wrote my own formatter.

The Adaptec scheme completely maps out a bad sector, the sector numbers continue
in order, you just have fewer than the product of heads x sectors x cylindars.
The result is that ANY higher leverl program (partitioner) need not worry
about bad sectors. (HDX 3.01 and other brands will play games with the TOS
format to work arround bad sectors; but MINIX and SPECTRE die.)

ps. this is better than my 6386 does -- it maps out a whole track for each
bad sector.

2317. Mouse weirdness

Newsgroup: comp.sys.atari.st
Date: 1990-10-02 13:58:54 UTC
From: iam@stbimbo.UUCP
Message-ID: <170@stbimbo.UUCP>
Source record: 238226

Can anybody explain the problem and (hopefully) a possible solution to this?

My mouse was having problems tracking up and down (left and right were fine). Sometimes it would move only down, sometimes only up. After much careful experimentation inside the cover, I found that if the cover was left off, it worked fine, but if you put your hand over the insides, blocking out all the light, it would start messing up again. Obviously, this indicates problems with the photoresistors or LEDs or such, but I was wondering if there was a simpler solution.

If not, anybody know where I can get a nice new mouse?

Ian

>course, that can be fixed.)

Don't ask me if GFA uses dirty tricks, but in fact: neither RTX
nor MiNT did manage to run the uucico in background.

By the way; I use a Ram-based version of Tos 1.4, and MiNT does not work
properly, if I use GEM.PRG to have MiNT run "behind" Gem. The desktop
seems to fail allocating memory for its screen setup, so I always get "0
bytes in 0 files"...

If I start MiNT the "normal" way, everything's okay. Even TeX runs
in the background! Wow!!!

To use TeXinfo you need either TeX (with macro file texinfo.tex) or emacs
(info mode). Both is available on the ST.

2323. GCC/RTX problem solved?

Newsgroup: comp.sys.atari.st
Date: 1990-10-02 16:09:49 UTC
From: david@doe.utoronto.ca
Message-ID: <1990Oct2.160949.5099@doe.utoronto.ca>
Source record: 238151

I had a chance (finally) to look at the GCC library source for the Atari ST version (actually, it was the source with Eric's mods for MiNT). I think that I have found the problem with running GCC under Micro RTX, and it is not (really) RTX's fault.

freopen() in the GCC library closes the previous file handle so that it can re-use the structure. If that handle is 0 or 1 (ie. standard input or output), RTX probably returns an error code where TOS doesn't. I have not seen the source for gcc-cpp.ttp, but I imagine that it attempts to freopen() stdout for its output file, and that's why it doesn't work under RTX. Since closing handles 0 or 1 is a flakey practice at best, I'd call this a GCC bug rather than an RTX bug, although DB might want to patch up RTX anyway. To fix the GCC` library, just do an isatty() on the handle before closing it -- or better yet, _never_ close the standard handles (it might confuse the shell).

Since I have seen no other public answers and lost my posting on this yesterday, the answer is: NO. My copy of TuneUp! from Michtron does *NOT* work with 32 Meg partitions. It dates from summer '89, and I have not received any upgrade notices. I called and complained about this and other nasty but easily fixed bugs, and was told that an update was due in summer '90. I've heard nothing about it, has anyone else?

Bob Pegram

Internet domain: pegram@griffin.uvm.edu
UUCP: uunet!uvm-gen!pegram

P.S. Guess I'll be getting Dave's program fairly soon.
Are ICD 4.XX 32 Meg partions fully compatible with
HDX 3.x partitions? I assume so.... RBPIII

P.P.S. Dave B, Darek M, and other Atari S/W vendors, just because I may prefer to talk about free or share ware on the net doesn't mean that I don't *buy* software, quite the contrary. I think that superior commercial software should be recommened on the net, and I do so, I have even recommended TuneUp for those ST owners who keep only 16 Meg or smaller partitions and are careful when using it. Inferior or buggy software I try not to recommend, if I know about better competitors (I didn't know about Hard disk Sentry when I recommended TuneUp). For example, a PD (or is it Shareware?) disk erasing program that I have (only the FATs are cleared, bad sector marks are preserved) has a superior interface to the one in the Codehead Utilities and seems to work just as well. If you want to see really buggy commercial

software, try "Mavis Beacon..."(typing tutor) on the ST. It bombs (a lot!, in *my* experience) with Tos 1.0 and doesn't work at all with Tos 1.4.
Speaking of commercial software, my copy of Diamond Back II doesn't handle my 32 Meg partition quite properly, it thinks I have a negative amount of disk space 8-); at least it should still back up the partition, I will find out this week. This is especially odd since my *17* Meg partition's space is reported correctly. Are you reading this Bob Luneski ?? RBPIII

>Also to upgrade them to 9 Meg you have to get a card like the SIMM card
>which sits in the CPU slot! this allows you to add more RAM! it cannot be
>done directly onto the mother board.

Of course it can! It's a hack of course...

At any rate, I have seen at least one 4(2?)Meg board which stuffs itself into
the mini-slot under the A500's belly. That's a recent board which you may
not have heard of.

Also, to add a harddrive to an A500 requires using that "CPU slot," and most
harddrive boxes come with room to put your memory -- adding more memory to
an A500 is no longer as painful as it was in the days when I had one...

>
>--- From a Ex Amiga user.

Again, since those days, it has changed a little. Now you don't even
have to open the A500 case to upgrade more than 512k memory. You can
either plug in a board in the old 512k slot or buy HD which can take
more memories.

Just stating the facts.

There is a program called MiniBBS that will do what you want. It will allow you to dial in remotely and enter your i/d and password and then have access to your ST. Also there is a do file for 'Flash' that allows you to do the same thing. Both these files are on GEnie ans many BBS's world wide, so look for them. If you are using a ms_dos type shell like command.prg or thelikes you can pipe the commands to the serial port like C:command >AUX: <AUX: this will give you full control of your ST from a remote site. I did have the pleasure last night to see 'Minix' set up on a 1040 running a serial terminal via copper and or by modem. It was great the first time I have seen Minix do this and I was impressed to say the leaste with the 2 user system David has written under Minix. You can email david here on STT or drop him a note in this news group and he will get it.. His mail address is STT@kcbbs.gen.nz (David Bouise).

Lines: 26

Re adding a second drive to the Megafile 30.
---
[1] The controller card you have in there is an ABC4070 (adaptic)
[2] You will have to select LDN 0 and SCSI 1 as the other will be 0
The dip swichs sit looking from the front of the megafile, next
to the power supply directly behind the 20way read/write lines.
[3] You will have to insert/soilder in another 20way read/write plug.
[4] You may have to get a slightly better power supply as the one I have
in mine is only a 40watt supply.

This is a brief overview and I hope it helps you with your project. I
think you will like alot of others out here find it easier to get a 40 meg
drive and place it in there and run it in rll and get 60 megs. Sure saves
alot of the hassells.

>squeeze every extra bits into the 192K ROM. We will try!

is it possible to recompile the tos with a better compiler, i understand
atari used alcon c and then later turbo c, would the old tos be done in
alcon ?

2334. Re: it would be nice

Well said,
I was getting sick of the ST bashing I had back in brisbane when I ran the only ST BBS for the whole city and was surrounded by Amiga users.
But I wound up selling my Amiga 2000b so I could buy a 4 Meg STe to joing my 2.5 Meg 1040ST.
As for sound, sure the Amiga has stereo sound, but quartet beats any Amiga sound program I have seen. And thats on a old ST.

One thing you forgot! the Amiga 500's originally were 512k, until recently
when Commodore upgraded them to 1 Meg.
Also to upgrade them to 9 Meg you have to get a card like the SIMM card
which sits in the CPU slot! this allows you to add more RAM! it cannot be
done directly onto the mother board.

2337. Ideas on how to get software to Atari ST

Newsgroup: comp.sys.atari.st
Date: 1990-10-03 01:31:02 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <8738@helios.TAMU.EDU>
Source record: 238153

Help!

I just got access to the atari ftp archive in the University of Michigan. I even got some XLISP files from it. But now I can't get them to my atari ST. I am using Uniterm, and I purchased InterLink. But the kermit program on this Amdahl UTS machine and the Kermit program from the VAX/VMS always gives me an error on the 4th packet. I have tried all three checking techiniques that Uniterm has (CRC CHK1 CHK2), but they all fail.

I have no trouble on ASCII files, just on binary ones. I do use ftp in the "I" (image) mode which I invoke by issueing the ftp command "binary".

Please send me some ideas. I'm so close to heaven, but I can't get up the last step.

Please send mail to "tamuts.tamu.edu!n160ao" and not to the whole net.

Thanks.
Mark Lehmann

2338. patch for MiNT library

Newsgroup: comp.sys.atari.st
Date: 1990-10-03 02:12:50 UTC
From: 7103_2622@uwovax.uwo.ca
Message-ID: <7236.270910e3@uwovax.uwo.ca>
Source record: 238243

The MiNT library mintlib.zoo on atari.archive (at patchlevel 1) has some bugs in it -- in particular, stat.c and unx2dos.c won't compile, as the result of a last minute cleanup that didn't quite clean everything up. (A header file, device.h, was removed; neither of the .c files actually used anything from that header, but they did include it, and stat() had a useless device declaration in it as well).

Here are patches to bring the library up to patchlevel 2. As well as fixing the compilation bug some new features are provided:

-- some new dummy routines added to avoid link-time errors
-- popen() re-written to use pipes instead of temporary files; this is a win under MiNT, but doesn't work under TOS. Ideally we should support both, but the library is big enough already :-(.
-- stat() and fstat() now give pipes and fifos a file type of S_IFIFO
-- fstat() was broken in several ways; it should be OK now
-- the assert() macro had the wrong parameter names (oops!)
-- osbind.h was being overly optimistic about the future development of MiNT; it seems unlikely that >14 character file names will be supported in the near future, so we might as well maintain 100% TOS compatibility here
-- re-arranged compiler.h a bit, and added support for the C68 compiler

I haven't uploaded the new library to atari.archive, because I'm still working on the C68 support (the GNU code should be quite stable now).

Please report bugs to the address at the bottom of this posting.

I am using GCC for a project of mine and need to know how to use the Gnu debugger gdb. I'm using the version of GCC whose binaries are on atari.archive. I tried the -gg option but that didn't seem to work. Any help would be appreciated.

2341. Audio in line on monitor port

Newsgroup: comp.sys.atari.st
Date: 1990-10-03 06:43:47 UTC
From: edd232s@monu6.cc.monash.edu.au
Message-ID: <1990Oct3.064347.10203@monu6.cc.monash.edu.au>
Source record: 238165
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

In the documentation that came with my 1040STFM, theres a pinout
on the monitor port labelled as 'audio in'. I havent heard of anything,
software or hardware that uses this, and I dont even know what it does,
if anything. Does anyone know what it can be used for, and if so how
can I go about it ?

I was hoping thered be someway to digitise with it, with the addition
of little or no hardware support.

Mithrandir.

2342. Re: TOS 2.0 for the ATARI ST

> basv@maestro.htsa.aha.nl or ...{backbones}!htsa!basv

Atari has NOT released _any_ TOS 2.0 and especially on disk. If you have a copy of a disk based TOS it is probably a pirated copy from one of our subsidiaries.

I would urge you NOT to use this copy and destroy it. It's probably dangerous. No telling where it's been and if it's an early version of TOS 3.01 like I think it is.. then it is riddled with serious bugs.

There are no plans to release TOS 3.01 (or TT TOS as it is also known) for ST machines. It simply won't fit into the ROM space.

From: bointon@kcl-cs.UUCP
Message-ID: <1186@xenon.kcl-cs.UUCP>
Source record: 238155

Help!!
I recently added a Syquest 44m removable HD to my Seagate ST157N system (with Gasteiner interface) and it seemed to be alright. However, fairly quickly the Auto folder on drive C became a little flaky, losing most of the progs and bombing on accessories. After a backup and reformat, the problem has not gone away. I managed to get a disk checker to spot several bad sectors right near the beginning of the disk, but they seem to have disappeared again! Does this sound like the results of a minor head crash?? The installation appears to be OK as drives D,E,F,G,H and I still work fine (over the two physical drives). Does anyone have any bright ideas?? I am pretty sure it is a hardware problem, as it seems to act independently of the software installed.

any help would be much appreciated

2346. Interfacing PC floppies...

2349. Gadgets' e-mail adress

Newsgroup: comp.sys.atari.st
Date: 1990-10-03 14:49:51 UTC
From: jeroen@plato.phil.ruu.nl
Message-ID: <780@accucx.cc.ruu.nl>
Source record: 238158

I cannot reach Gadgets by Small, and I really need to. So: what's
Dave's email adress?

I've posted about this before, and I got some answers too back then.
None of them however seemed to succeed in reaching mr. Small, although
it did not bounce back to me - it just seemed to get lost (.. or Dave
Small didn't care to reply, but I don't think so).

In my Spectre user manual no usable email adress is stated:
they are all incomplete uucp adresses (...!thewell!dsmall).

So I'm out of arrows: can anyone help me on this one?

Yes I'm reading :-) It's a benign free space counting problem at the user
interface level that has been corrected in the latest version of
Diamond Back II V2.11. Rather ironic that a Statistican should have a
counting problem, eh? It does not effect the backup as Diamond Back II
will backup any GEM, BGM, or XGM partition in either file or image mode
and any Spectre partition in image mode.

You can upgrade to Diamond Back II V2.11 by downloading a patch file from
Genie or by sending your original disk to Data Innovations. In addition to
a number of bug fixes, the free upgrade includes a 3x speed increase in
HD to HD transfers, full support for high density 1.44+ meg floppies, and
the addition of a number of utility programs(formatters, file finders etc.)
in both .PRG and .ACC forms.

2351. can 4MB dynamic rams turn a 1MB Atari ST into a 4MB Atari ST

Newsgroup: comp.sys.atari.st
Date: 1990-10-03 16:26:01 UTC
From: cca13@seq1.keele.ac.uk
Message-ID: <656@keele.keele.ac.uk>
Source record: 238163
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,
I have a 1MB Atari ST which I use at home. At work I read the SUN group mail/news and there it seems folk are upgrading various Sun machines cheaply and quickly to have 4x the memory, often 8MB to 32MB, by plugging in 4MB SIMMS.

I wondered if it is possible to do this on an Atari ST - just remove all the chips and replace them with 4MB ones. Please email me directly as I don't read these groups.

many thanks

> >either PD or $$.

Simon Poole's DLII includes a defragmenter; I haven't used it so I can't speak to its effectiveness. As a whole the utility is very complete, however, and I believe freeware.

Of course, you can also copy all the files to an unused partition, delete all files, then copy them back (if you've got the room on your drive). Probably a safer and certainly a faster way to go...

Great. Now it looks like there is ANOTHER program out there which is
stupidly named. Not only is it a derivative work of Atari's
copyrighted material, but it's got a name which guarantees confusion
with official Atari products.

People, don't do illegal stuff, or if you do, PLEASE choose names which
won't make people think the thing came from Atari! I think Claus Brod
can back me up on this one. :-)

From: bill@mwca.UUCP
Message-ID: <1711@mwca.UUCP>
Source record: 238176

Has anyone been able to make Quick Tools load the environment upon bootup automatically? At Darek's instruction I put quiktool.prg in the auto folder, and have ENVIRON.SYS in the auto folder, the quiktool folder, and the root, but none of them get loaded unless I explicitly load them from QuickEnv or Quick CLI.

Also, I get a crash with Quick Control every time, regardless of auto progs and accessories. Quick Term generally doesn't care to work, either, though I haven't tried it as extensively.

Are there any known bugs here, or am I missing something in the manual or perhaps I have a corrupted diskette?

Sound injected into this gets mixed with sounds from the noise
chips in the ST (and the DMA sampled sound in the STE), and come
out the 'audio out' port. Simple.

> I was hoping thered be someway to digitise with it, with the addition
>of little or no hardware support.
>
> Mithrandir.

Would it not be nice ?
Seriously, it is useful to have the pin there; it means one can
hang sound samplers inside the case, rather than dangling in the
cartridge port. Still need extra connectors if one wants to add
samplers of stereo sound.

Question:
What are the pins on the Monitor jack of the STE, labled 'clock' ?
(I think I did hear, but can not remember ...)

2365. CD-ROM

Newsgroup: comp.sys.atari.st
Date: 1990-10-04 15:08:17 UTC
From: gjh@hplb.hpl.hp.com
Message-ID: <GJH.90Oct4160817@ghiggins.hpl.hp.com>
Source record: 238191

What's the current state of play regarding CD-ROM for the ST?

The reason I ask is that there's a Sony portable CD player available here in the UK for an affordable 250-odd sterling. It has a built-in SCSI i/f, so in theory, should be connectable to an ICD DMA-SCSI adaptor.

Given that it's a Sony, ICD reckon that their driver s/w should be able to recognise it.

Is that all that's required, or am I missing a trick somewhere? Shouldn't there be some kind of hassle like incompatible disk formats (High Sierra vs Low Swamp or somesuch)?

It's not that I'm cynical, you understand, just skeptical.

Cheers,

Gray

2369. ST Writer Elite 3.8 ?Bug? -- TOS 1.4 Ramdisk

Newsgroup: comp.sys.atari.st
Date: 1990-10-04 18:13:10 UTC
From: kendall@bsu-cs.bsu.edu
Message-ID: <11862@bsu-cs.bsu.edu>
Source record: 238185

To all who responded last time: Thanks much for your advice.

I have been unable to get printer codes to work from any ST Writer Elite 3.8 document. Neither <CTRL-O>nnn or any variation of <ESC>, <CTRL-ESC>, <ALT-ESC> seem to work, although the docs say that either method should work. The result is that no codes are send. This is true under TOS 1.0 and 1.4. Can anybody help? Is there a more recent version, or maybe a patch?

Also, I just got upgraded to TOS 1.4. Are there any good ramdisks that work under TOS 1.4? My previous favorite seemed to cause a reset on any application call. ACC-based would be perfect.

And in reference to recent cross-flaming, yes, I will consider any kind of *ware: free, share, or commercial.

DRACHEN is a version of Mahjongg the comes out of Germany. It
has excellent graphics, but is a mono only game. It was posted
to comp.binaries about a year or less ago, thus you can get it
from one of the archive sites.

>preferred switcher?
>
>I just glanced at Talon's ad in ST Informer and they have an Acer
>monitor for $450.
>
>Thanks for the help.

I like my multisync, though I still have both the old mono & color monitors sitting in my closet... You just need to make sure it handles around 15-35khz horizontal scan rate, and 50-70hz refresh. Mine was also around $450, I went bargain hunting in Computer Shopper.

I have noticed wavy interference on the multisync in monochrome mode, which is quite distracting when you have a mostly white screen. If most of the screen is black then it's not apparent, So, to be real picky, the monochrome mode isn't quite as rock-steady as with the Atari SM124. But it's still pretty good, and with overscan I get 736x480 pixels instead of 688x480. That tells ya something too - you don't need much better than an 800x500 resolution display. (Unless you also plan on getting something like the ISAC board...) Mine has a .25mm dot pitch, for 1024x768 max rez, but I guess that was a frill that I'm not getting any benefit out of at the moment.

Also the pixels are really pretty tiny in monochrome mode... Something to consider if you're gonna be staring at it for long periods of time.

2376. PC Emulator Question

Newsgroup: comp.sys.atari.st
Date: 1990-10-05 00:06:12 UTC
From: Bill_von_Hagen@TRANSARC.COM
Message-ID: <cb2wtoT0BwwfRBJnBi@transarc.com>
Source record: 238102

Since there have been several posts about PC-DITTO-2 recently (and there doesn't seem to be anyone left at Avant-Garde to ask), I thought I'd ask for some info about getting Ditto-2 to boot from hard disk. It took me long enough to get it to run, period, but that's another story. When I boot from my external 5.25 disk, everythign works fine, but it just loops on asking me to insert a disk if I don't. It doesn't seem to recognize drive C at this point, though I formatted it using DOS and have installed all the system files.

Any help would be appreciated. Please send mail to me directly, though I'll be glad to summarize to anyone who's interested. (I don't want to bog the net down with Ditto flames.)

Thanks!

Bill (wvh@transarc.com)

>
>I see some problems whit the GDB
>....

>does any one know if i am wrong ???
> Thilo Scheulen

J.R. Dunning ported GDB to the ST a while ago. I don't think it works
with the current version of gcc though.

'sswhat you get when your vendor doesn't set a standard way to do certain
things; a bunch of different people take different approaches to solve the
problems...

Now that I've started playing with Mint a little bit, I'm beginning to
think about trying to build everything else around it. Question is what
to attack first. Gulam is the most useful shell to me, so I guess I want
that working with job control, but there's something to be said for a
Unix-ish shell (like Bash) being available.

I was really thrilled to see MGR running on my ST. This is really exciting
stuff going on here...

2380. Which computer next? (Advice request.)

Newsgroup: comp.sys.atari.st
Date: 1990-10-05 02:27:53 UTC
From: robertl@alpha.la.locus.com
Message-ID: <17905@oolong.la.locus.com>
Source record: 238118

I currently am a satisfied owner of a 520st, 1Mb, Megafile 30
with a Spectre GCR. I now would like to get more utility then
my current set up provides. I have thought of 4 options:

1) Buy a Mac IIc?. Ever since getting the Spectre, I've been
considering buying a MAc II. They are nifty machines but
priced outside of what are could reasonably afford for my
hobby machine.

2) Buy a PC clone. For $1500 I can get a 80386sx with Super VGA
and 65 MB HD. My far the best bang for the buck.
However as the old saying goes: Friends don't let friends use DOS!

3) Upgrade my current machine. The local outfit will upgrade to
4MB for $450 and and another $300 for an accelerator.

4) Junk my current cpu and replace with a 1040 STE.

My uses for this machine include Word processing, DTP, record keeping,
games and programming (C & C++).

Opinions, comments and other alternatives are welcome.

Thanks,
Robert Lee

2382. MiNT library (yet again)

Newsgroup: comp.sys.atari.st
Date: 1990-10-05 02:36:08 UTC
From: 7103_2622@uwovax.uwo.ca
Message-ID: <7292.270bb959@uwovax.uwo.ca>
Source record: 238112

Several people have had trouble applying the MiNT library patches I sent out (I used forward slashes instead of backward ones -- I guess not everybody has the same version of "patch" as me). Also, the file ftw.c was still not compiling correctly. So I've bitten the bullet and resent the library, with patches applied (so it's now patchlevel 3) to atari.archive, as "mntlib03.zoo". This one really does work (I recompiled everything from scratch), although as with all gcc stuff it helps to have lots and lots of spare memory :-(.)

If you're having trouble compiling an earlier version of mintlib.zoo, grab this one. Make sure the GNUINC environment variable is set to the new include directory, too; some of the files are not compatible with the old gcc library. Also, I've only tested this with gcc 1.37.1; 1.36 should work too, but I don't know about earlier versions.

Sorry about the compile problems. I've learned (again!) how useful "make clean" is!

2383. what to do if MGR runs out of memory

Newsgroup: comp.sys.atari.st
Date: 1990-10-05 02:44:01 UTC
From: 7103_2622@uwovax.uwo.ca
Message-ID: <7293.270bbb31@uwovax.uwo.ca>
Source record: 238113

If you're running MGR on a 1 megabyte machine, you may find yourself unable to open more than 1 window. This is because MGR contains a fork() call, and that's a very memory-expensive operation. It may help to open subsequent windows with the demo program "half.ttp" instead of from the MGR desktop; the syntax is "half <name of program to run in new window>".

Also: MGR will automatically delete a window when the top-level program in it exits. This is the preferred method of killing a window; selecting "delete window" from the command menu is somewhat less useful, because it may not succeed in killing off the programs running in the window (for various reasons). For this reason, if you run out of memory check drive X: for programs that were running in a now-deleted window; if you find one, kill it (either with kill.ttp or any sort of file deletion program).

How about releasing a RAM version for the ST? Lots of people would
prefer that to none at all. If you made it bootable from a hard disk,
the time to boot would not be significant. Maybe it wouldn't be so
useful on a 1M meg machine, but there are a lot of ST's out there with
2M or more of memory.

> ... anybody know where I can get a nice new mouse?

> Ian

Call E. Arthur Brown Co. at (612)762-8847 and ask to talk with Mr. Brown himself. Lsat I heard, he had 4 different mice?mouses?meeces in stock, ranging from the original ST mouse at $40, to a beautiful cordless model at $80 (? don't quote me on that price). I got a high-res optomechanical one made by Practical Solutions (?) that I really like. The button travel is a little farther than I'm used to, but I wouldn't consider that a serious drawback.

I've had several dealings with EABCo. and they're very honest, prompt, trustworthy, loyal, helpful, friendly,... Consider this an endorsement.

To all G++ gurus and developpers!

I am looking for the latest G++ compiler & libraries for the Atari ST.
If anybody is working on new libraries:
Is it possible to post them on comp.binaries.atari.st?
Or if not, please send them on disk to me:

--- M.Backschat, Bergstr.16, 8071 Hepberg, Germany ---

I - of course - will take over all costs!

I've got G++ 1.35 and pre-released libraries (not fully implemented on the
ST yet). If anybody needs this version, send me five DS disks and a
SAE enveloppe.

>nor MiNT did manage to run the uucico in background.

Well I'm trying to figure out what GFA is doing that causes it to
break under RTX. It sort of works, but some calls don't seem to
work right. It appears that GFA is fiddling with something in GEMDOS
which it shouldn't be, but I haven't figured it out yet.

I know GFA programs don't run on the TT.

2392. SYSMON bug with PoolFix4

Newsgroup: comp.sys.atari.st
Date: 1990-10-05 10:03:47 UTC
From: jeroen@pluto.phil.ruu.nl
Message-ID: <782@accucx.cc.ruu.nl>
Source record: 238104

I've just discovered a bug in SysMon, which may be of a general nature,
that occurred when I tried to find PoolFix in my program list.

The trouble was: poolfix was in the table as " rul_Prg", but it really
should be "_OOL_Prg", were it not that SysMon knows about "_OOL" and
tells you it's PoolFix if it finds it.

Now why did SysMon think the XBRA-id of poolfix was " rul"?
Examining poolfix4 with a disk monitor, I found out it contained
some message ".. not following XBRA rules", of which the part
"XBRA rul" looks - yes! - just like a XBRA id (but it isn't).
So I guess SysMon just finds out which programs are hooked into
which vectors, and then searches the program's code for an XBRA
struct, thus falsely recognizing "XBRA rul", since it occurs
in Poolfix4 before the "XBRA_OOL" *REAL* XBRA id.

The fix I made was convert "XBRA rul" to "xbra rul"; I rebooted
the machine, and - voila - SysMon told me about a program
PoolFix being resident.

This problem may occur with other programs containing messages
with "XBRA" as a substring, if it occurs before the real XBRA
id; so SysMon really should check whether the id it thinks is
an XBRA id really is located 12 bytes before a routine which
adress is stored in some system vector.

I post this here, because I did not find a true email adress
of mr. Ivanovic (sorry about misspelling the name) in the SysMon
manual; for now we can all correct the bug in an ad hoc way, until
it is fixed in SysMon itself.

I am thinking about buying an TT. I have two problems: which minimum configuration (memory / disk space) should I choose to be able to run Unix at a later stage? Will the Unix be affordable? I think it should be below $750 to be feasable if you consider my budget and the price of the TT.

Greetings, Ryko Prins

2394. Any hardware hacks anyone ?

Newsgroup: comp.sys.atari.st
Date: 1990-10-05 10:42:30 UTC
From: mike@abekrd.UUCP
Message-ID: <1425@abekrd.UUCP>
Source record: 238129

I have been following the discussions on comp.sys.amiga (just out of interest) and they're talking about doubling the processor clock speed. Now I know about hacks to upgrade the memory (done that); add my own second internal drive (done that); make the display bigger (thinking about it :-))...

Has anybody done any interesting (and fairly simple) hardware projects to boost this wonderful machine in other ways? Can _we_ double the ST clock to 16 Mhz ? How about a homebrew remote keyboard ? Or details on putting all these disks & ST motherboard in a small(ish) PC type box ?

Come on guys, lets make this machine _work_! Either E-mail me or post details to comp.sys.atari.st.tech. I'll summarize any mail there too.

Mike.

PS. The second drive mod involved replacing the internal drive with two thin 3.5" drives, a new ribbon cable, adding one wire to the motherboard and a little bit of sawing on the chassis (Not recommended if your machine is still under warranty :-)).

2395. What's the newest Timeworks version?

Newsgroup: comp.sys.atari.st
Date: 1990-10-05 11:42:15 UTC
From: jalkio@cc.helsinki.fi
Message-ID: <3298.270c7197@cc.helsinki.fi>
Source record: 238200

I like Timeworks very much, but I would like to know what is the newest version. Mine is 1.12 and I would like some features added.
So if somebody has a newer version, I would be happy to hear it.

Jouni

(Actually I kind of prefer the Timeworks to Calamus, because the small fonts are much better on Timeworks (and a 300dpi laser) and it is faster, too. Of course I would like the Calamus features on Timeworks.)

wilko@idca.tds.PHILIPS.nl (W.C. Bulte) says:
> The last month or so I have been busy trying to reach Gadgets by Small, the
> makers or Spectre.
> Email is never replied upon, an airmail letter apparantly faced the same destiny
>
> As a last resort, I tried sending a fax. And this didn't work either.

There are several things that have could be causing your problems.
First the system that gadgets is fed from isn't the most reliable in the
world (it's a dying 7300). There have been lots of problems with email
and netnews for the last few months. Gadgets is looking at getting
another feed (probably uunet), but it will be awhile before that happens.

As to the letter and the fax you may have just picked a bad time,
Dave and Sandy were gone for over a week last month (computer show and
a short vacation with the kids). They are back now but are busy getting
ready for the next release (version 3.0) so they may not have answered all
their waiting mail and fax messages yet.

The most reliable way to contact Gadgets is phone (voice or
fax), unfortunately that isn't a cheap option. Next best is GEnie,
in the Gadgets roundtable. Usually you will get a response the same day,
occasionally it may take two or three. Next best is either email to
the well (...!hplabs!well!dsmall or dsmall@well.uucp) or to gadgets
(...!boulder.Colorado.EDU!tcr!gadgets!dsmall). Neither of those is
very reliable, one has machine problems and they both have problems with
replies (I can't always send mail from tcr or gadgets to my work machine,
and I'm SUPPOSED to know what I'm doing ;-).

2402. Flight Simulator II

Newsgroup: comp.sys.atari.st
Date: 1990-10-05 15:54:07 UTC
From: dac@ukc.ac.uk
Message-ID: <5632@harrier.ukc.ac.uk>
Source record: 238120

After my previous news posting a couple of weeks ago for information on
SubLogic's Flight Simulator the summary is as follows:

1. Everyone (who mailed me) loves Flight Simulator II
2. SubLogic do not seem to be supporting the ST any more and so will not
be releasing Flight Simulator III.

That's a real shame.

Dave.

Access Computers in Santa Clara has the PanaSync (1024 x 768, .28 mm dot pitch) for $429. These are similar specs to the NEC 3D which rarely drops below $569, and I suspect that Panasonic makes a decent monitor, though I have no firsthand experience.

Simon, are you listening ? I have observed a problem when trying to
recover a deleted file. It seems that dlii writes the directory sector
(n) back to sector (n - 1). It should be easy to correct at least
this in the source, but we don't have the source :-(. For now i am
saving the sector in a save position on the harddisk and the copy it
back after doing the recover. Everything else seems to be ok.

2406. Uniterm fonts

Newsgroup: comp.sys.atari.st
Date: 1990-10-05 16:50:23 UTC
From: eckmann@ashley.ucsb.edu
Message-ID: <6458@hub.ucsb.edu>
Source record: 238121

Someone recently asked how to change fonts in Uniterm, and the only reply I saw was an excerpt from the V2.0d ReadMe file. I apparently need more specific instructions. I want to use my own favorite 8x16 font in the vt100 screen instead of the default system font. Is this possible? My GEM font (constructed with Fontz) is not acceptable to Simon Poole's make_uft program. (And Simon's sample GEM fonts get lots of complaints from Fontz.) Are there different GEM font formats? If so, how can I get my font into the right format? Assuming I can make a UFT font, I need to load it and change to it. How?

Thanks.

2407. Booting DOS from C: with PCDITTO (software version)

Newsgroup: comp.sys.atari.st
Date: 1990-10-05 17:30:36 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1990Oct5.155245.25221@rodan.acs.syr.edu>
Source record: 238124

I'm sorry to post with this problem again, but the circumstances were slightly different this time. (Thanks to Howard and Bill for replying to my earlier post.)

I have been able to follow instructions to get PCDITTO to boot DOS from C:. In the past, the boot capability seemed to disappear when I messed around with the GEM autofolder under TOS. Well, I went through setting up C: to boot from DOS again, and everything was fine...until it didn't work again! This time I DID NOT mess around with the autofolder...I may have copied files around on the disk, but I don't see why that should cause a problem.

I was told that io.sys and msdos.sys had to be the first files on the disk. Well, I checked with DLII, and it listed them as the first two files in the directory tree...Isn't that good enough? I guess not. Well, there must be something going on here that I don't totally understand (not too unbelievable). So if anybody can help me out, I would greatly appreciate it...I need to understand what to do, AND know what program to get that will allow me to do it! Thanks very much.

>>that occurred when I tried to find PoolFix in my program list.
>[Description of the bug follows]

Hello out there,

i haven't yet got your bug report, just the answer of Claus, but i can
figure out what it is. SysMon takes the string after the first XBRA
it finds in a memory block.
I will replace the sequence of calls, that SysMon first checks out
if there are vectors pointing into the memory block and get the XBRA
ID, if there is one. If no XBRA is found in the traps, it will search the
memory block for XBRA-IDs. (It is possible that another program
hooked into the trap without XBRA)

I was just preparing a posting of the new version, but i will first fix
the 'bug' and send SysMon 1.0.5 (with english docs!) tomorrow.

>
> Howard Johnson

I am intrigued by this.

Does the Adaptec 4000A have some non-volatile memory in which the bad
sector list is stored?
-or-
Does the Adaptec have some RAM in which the list is stored, which is stored
on the disk and automatically read by the Adaptec on power-on?
-or-
Does the Adaptec have some RAM ... , which has to be initialised by the
driver software (booted from sector 0?), which knows where the bad sector
list is stored on the disk?

Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

I hate to say it, but in addition to four or five Atari 8-bit systems
I also have an Amiga, and let me just point out that the Amiga does
all the stuff you claim for the ST (Mac and PC emulation, e.g.) PLUS
can multi-task (actually RUN more than one thing at a tim -- I regularly
download from Portal and play a video game on the system at the SAME
time...

Far be it from me to say any particular computer is better or worse than
any other, but if all you're interested in is emulation of OTHER computers,
you might as well get those AND some other nifty stuff. Emulate the PC
in one window, and do something else in another at the same time, heheh...

Note: I don't have full details on what it takes to do all this stuff, as
I have access to real PCs and Macs and don't bother with the emulators;
I DO have a friend who does this though: write to aegnor@bsu-cs.bsu.edu
for a well-considered and knowledgeable response.

A second question: how do you use TeXinfo files on the ST? Do
you need Gnu emacs? For that matter, how do you use them on
Unix?

Thanks.

As some postings already mentioned, GNU EMACS is available for the
Atari, which can than be used to format and view TeXinfo files. To
produce a printed manual, you need TeX.

If you are satisfied with on screen displaying, there exits two programs by
Brian Fox, the author of BASH, called "info.c" and "makeinfo.c".
"info.c" allows you view a TeXinfo file on screen and "makeinfo.c" is
used to format the TeXinfo file into an info file.

Both program compile without any problems on the ST using GCC 1.37.1.
"info.c" requires some commenting of signal() stuff and a termcap
entry. In "makeinfo.c" there is a constant hardwired to 4000, which
causes the program to run out of memory on my ST. I changed it to 1000
and everything worked fine, that is, I could format a 98K TeXinfo
file.

Hope, that help.

When you buy the Atari CDROM you get (logicaly) three pieces:
1. the CDROM player (CDAR504)
2. a Driver to talk almose SCSI to tell it what to do.
3. the cd rom extensions to TOS.

Really it just called metados and the appropriate format interpreter; e.g. high sierra. I phrased is as above because that is what you get for a PC clone and Atari did a very creditable job of producing the same function.

The cd rom extensions are really needed, and quickly show the difference between good applications and others. Remember that if TOS is to read a file it normally has to think interms of a 16 or 32 MB partition, MAX. (forget the hdx 3.01 extensions; they dont apply). The CDROM is likely a singel file system of up to 1200 Mega bytes.

The extensions trap all the FS unique system calls, such as FSFIRST, FSNEXT, READ and do it differently.

The High Sierra, and other formats have to do with how the large file system is organized. HS looks like TOS (MS/DOS) with out fats. All files are contiguous you only have to find out where they start.

When I interfaced the CDAR504 to PC-ditto I, these items all had to be handled for MS/DOS.

The bottom line is that you need a heap of neat software to utilize as CDROM player. One way to get it is to buy an Atari CDAR 504.

There is still a reason to go with a SONY or Hitachi. Multimedia.
This is where voice/music and data are intermixed on the CD ROM. the Atari unit cannot handle this at all!

I cuss them a lot and hope I can figure out which lharc/lhunarc/lzh program
matches the one used to create the archive. If I can get them unbundled,
I repack them with ZOO, so I can trust the results.

LZH is a good idea, but some of the people implementing it on the ST have
made bad and nonportable assumptions about structures, word ordering, etc.,
resulting in serious incompatibilities. It's like trying to pick a lock.
If you can find the right combination, you strike it rich.

Get all the LZH archivers on Panarthea and atari.archive.umich.edu -- eventually
you'll need every one of them.

While at the World of Atari in San Jose last summer, I bought GFA BASIC 3.0 from the man at the Michtron booth for $35. Did I get duped? I saw that they were selling GFA BASIC (some earlier rev) for $5, and commented that it wasn't the latest, and the man said, "We have the latest, over here." And I asked him if he was sure it was the latest rev and he said it was. But there is no COMPILER with it, and I thought that the latest rev of GFA had a compiler! What gives?

There is a program that I have seen which appears to be just a replacement
desktop - not the rest of TOS. This installs in the AUTO folder and clicking
on the About... gives TOS 2.0 (C) 1990. This seems to have half the features
of TOS 3.x and numerous bugs (Can't select folder sorting properly,
occasional crashes, etc.) It also contains a full symbol table.

This seems rather surprising behaviour; it would annoy me as a user.
As it seems, you have never used X-Windows with the MWM Windowmanager.
I you want, you can install such behaviour.

The unability of GEM to work with other windows than the top one,
or to top hidden windows is rather a drawback.
Surely, nobody would claim that there is nothing that can be
added to GEM :-)
Finally, all that depends on your application. Nobody keeps you from
adding such features. It might even be possible to add this into
the system by writing a TSR that spits out appropriate WM_TOPPED Messages
upon hitting the hot-key.

Somewhere in the Uniterm docs it mentions that Uniterm fonts use standard
GEM font data but without any of the header info. I guess that means you
define all 256 character values, and since it only allows fixed-width
fonts, and knows what sizes it expects to see, it reads the data into
memory without any consistency checks or whatever... See if you can strip
your Fontz output files down to the proper dimensions...

A second internal drive, huh? Kind of an interesting idea. Don't think
I'd care too much one way or the other. (Especially since the Mega's power
supply is already straining just to keep the fan and floppy running...)

>Has anybody done any interesting (and fairly simple) hardware projects to
>boost this wonderful machine in other ways? Can _we_ double the ST clock to
>16 Mhz ? How about a homebrew remote keyboard ? Or details on putting all
>these disks & ST motherboard in a small(ish) PC type box ?

FAST Technologies' Turbo-16 has been around for a long time now. The
installation process is tedious but straightforward. ICD also has a new
accelerator, which is said to be even easier to install, also uses a cache,
and is more compatible. (I.e., Turbo-16 doesn't let you switch back to true
8 MHz operation, the ICD accelerator is supposed to allow this. This is
crucial for time-sensitive code like Spectrum 512 uses, or copy-protection
code for many games.)

You can double the clock going to the floppy controller, and drive high
density (1.2 and 1.44 meg) floppy drives. I think Best Electronics has
a kit for making the standard ST keyboard detached. There are a couple
companies advertising PC-style cases for ST systems as well. Just find
yourself a copy of AIM or some other good Atari magazine and look thru the
ads...

>Come on guys, lets make this machine _work_! Either E-mail me or post details

>
> Mike.
>
>PS. The second drive mod involved replacing the internal drive with two thin
> 3.5" drives, a new ribbon cable, adding one wire to the motherboard and
> a little bit of sawing on the chassis (Not recommended if your machine is
> still under warranty :-)).

For a *really* intense project... Reverse engineer the Atari custom chips,
then rebuild for faster operation. (Of course, ya gotta figure, if Atari
couldn't do it themselves, having the original chip designs onhand, it's
probably not something you wanna try on your own....)

What we need at this point are ST clones. That's what drove the prices down and the performance up in the PC market.... Systems with compatible hardware but offering higher throughput, clock rates, etc...

Lessee... How 'bout a dual-ported RAM system, and a faster memory control unit, or heck, a PMMU. I don't think there's too much of the OS that's dependent on the way the GLUE/MCU/DMA stuff are split out. Just keep the DMA and MCU controller registers in the same place.... The blitter would probably pose some problems though. (If you wanted to duplicate it. Chances are, you won't care.) So what do we need... 68030, fast memory, better video hardware [JRI or ISAC can provide that, right?], the WD floppy controller, the Yamaha sound chip (or the improved model, if you can find it), the 68901 MFP, a pair of 6850s, hm... that about covers it.

Dunno how you could build such a system for cheaper than Atari can, tho, considering that they already have their mass-production facilities for economy of scale, and based out of Taiwan, so they already have the cheap labor. Hm. Mebbe not such a good idea after all. Who knows.

I know someone else answered your quesion by mentioning a program.

But, there is another way which for som may be easier, because you can do what is needed without getting any more software and learing how to run it.

Start with an empty "AUTO" folder. Copy the ".PRG" files into the folder, one at a time, in the order in which you wish to have them execute. That is all. If you use a RAM disk, it should be first.

Now, *I* will mention a program. If you want your AUTO folder to start a GEM program, you may have to use a trick. For instance, once upon a time, I wanted a floppy fixed up with 1ST_WORD word processor, so that I could just turn the system on and then 1ST_WORD would start. Sadly, it was not good enough to put the program 1ST_WORD.PRG in the AUTO folder. That did not work.

However, there is a free program called "startgem.prg" that allowed me to get the effect I wanted. I copied STARTGEM.PRG into the AUTO folder last. And then, in the file A:\STARTGEM.INF (or C:\STARTGEM.INF if you use a hard disk) I had one line of text that named the program I wanted to run.

I was under the impression that the problem with handling the mixed audio/data CDs in the Atari CD-ROM unit was just a software problem.

Is it? If so, it will eventually be corrected as these discs become more popular, I'm sure.

Based on the post by David Clear that SubLogic seems no longer interested in supporting Flight Simulator for the ST as far as a III version, I echo that it's a shame. There are some neat thing that have been added to other machine versions of the game I'd like to be able to have. They do come out with new scenery disks from time to time. Why not a new version? I would certainly buy it. I'd really like to play with realistic clouds and weather.

Does anyone have a copy of the HS232 desk accessory by Jon Webb (of LHarc fame)? I've been informed that this DA was written by Mr. Webb so that you can now lock your serial port at 38400 bps instead of the standard 19200 bps. Now, as an owner of an USR Dual Standard and an Atari ST, this would be quite useful. Especially seeing how that I finally received my v.42bis upgrade to the Dual Standard. In any event, I would imagine that this would be a rather small DA so if anyone can uuencode up a copy and send it along to me, I would be most grateful. Thanks!

(Hey, in return, I can send a few samples out of my Simpsons library. It's now 20MB in size and will be growing pretty quickly since the new episodes are coming out next week!)

The usual causes of this are running out of memory (not likely with the first window, but possible if you've only got 1 meg and have a lot of memory resident software, e.g. a big ram disk), or not having the SHELL environment variable set properly. Check your definition of SHELL in "init.rc" (or whatever the startup file is for the init program you're using).

If the problem persists, you might want to try hitting CTRL-ALT-F1 before opening a window; this should cause MiNT to report any system call failures, so you'll get an idea about what's wrong (e.g. a malloc failure means you're out of memory).

Mike,

There are several programs that will allow you sort the order of your auto folder. The one I use is called "Auto.prg" and is good for just that. You select what you want first like.. from these files
[1] Pinhead [2] TurboST [3] USR [4] Deskmgr [6]saver [7]50_60
so you click on them in the order you want and you get..
[1] Pinhead [2] Deskmgr [3] turboST [4] USR [5] saver [6] 50_60. Get the idea. You will find this .prg on most BBS's and also on GEnie.

Hi Netters and PDN users..

Just a quick note on our BBS here in Auckland.
Within the next month we will have IPDN [International Public Data Network]
or as it is also known as X25 or Packet Switch access to STaTus BBS here in
Auckland New Zealand.
This means that you will be able to access us from anywhere of 152
countries world wide. What I want to know is there much interest out there
for this type of service. We do NOT charge for the service it is free to
all Atari Users and non-atari Users for that matter.
The connection is via a network here in NZ called Paxus Fax-Net (see future
posting in Z*Net), they do how ever charge a monthly fee for the network
like tymenet. The charge is $NZ9 per month or this equates to roughly
$DM8,$USA6,$AUS7,Sterling 3. This charge is for unlimited use and
unlimited kilosegments on their network.
Your local countries IPDN fees still apply.
So please email or reply on the net here if you will with your comments..

Mail address are..

How about uploading your sounds to atari.archive.umich.edu? The samples
are in atari/sound/sounds. There are a lot of samples there already,
but more are always welcome. (Upload into the atari/new directory.)

So far I'm the only person to upload sounds there -- c'mon people,
why so stingy?!? (Thanks go to the few people who mailed me samples
to upload, however.) I'll even index the new sounds! How simple
could it be?

The terminator posse are doing a great job with atari.archive, but
remember that they do not get paid for this! If you have interesting
programs/data, please contribute!

(Not meant to single out Henry...)

Thanks all,

Dave Baggett

2446. Laser C V2.1 vs MiNT??

Newsgroup: comp.sys.atari.st
Date: 1990-10-07 17:27:18 UTC
From: kentd@FtCollins.NCR.com
Message-ID: <KENTD.90Oct7182718@zappa.FtCollins.NCR.com>
Source record: 238070

Has anyone run into any problems using Laser C V2.1 with MiNT? I'm compiling from Gulam (not using their GEM shell) and the compiler gives me two bombs. Also, I have a number of TOS-type utilities I've written and they all cause MiNT to hang...

I wrote a simple program to print out it's own argument list as a test, it runs under TOS and hangs under MiNT.

I'm using MiNT06 as posted to comp.binaries... FOLDR100 and MACCEL33 as auto folder programs and have 2.5Mb of RAM.

Has anyone else seen this?? If so, is there a workaround? If the problem is Laser I'm guessing it's in the cinit.o (initialization object file)...

|In article <895@ehviea.ine.philips.nl> leo@ehviea.ine.philips.nl (Leo de Wit) writes:
| This seems rather surprising behaviour; it would annoy me as a user.
|As it seems, you have never used X-Windows with the MWM Windowmanager.
|I you want, you can install such behaviour.

Sorry, I don't follow your logic; even if you know a piece of software doesn't mean you will not find anything in its behaviour surprising. I was only recently again surprised that GEM always tops windows; that does not mean that I don't know GEM, or the fact that it tops windows.

|
| The unability of GEM to work with other windows than the top one,
| or to top hidden windows is rather a drawback.
|Surely, nobody would claim that there is nothing that can be
|added to GEM :-)
|Finally, all that depends on your application. Nobody keeps you from
|adding such features. It might even be possible to add this into
|the system by writing a TSR that spits out appropriate WM_TOPPED Messages
|upon hitting the hot-key.

Sure, I think it can be done. But look at the other side: compatibility, standards. For instance, if a program for some reason uses the fact that a completely hidden window can't be topped - which it is allowed to - it (or you) will be in for a surprise if you top such a hidden window by means of a TSR.

Also, when application programmers just hard-code this behaviour in their programs, we get GEM programs that can handle hidden windows, and GEM programs that can't; this is confusing for users (what I would call surprising behaviour). Even in GEM there are some rules about how you present stuff to the user (the book Programmer's guide to GEM by P. Balma and W. Fitler gives excellent directions about do's and dont's); one of the basic rules I think is that you use a consistent interface.

We thank you for your attention ;-)

Leo.

2448. cpanel at terminator

>
> John T.

I wish I could tell you what to do to get the CPANEL terminal option to work,
But I have had the same problem with it. I thought that maybe it tries to
open the terminal emulator DA, but still no luck...

One reason I used CPANEL for a while cause it allows you to change the
stepping rates of your disk drives, and having a 5.25" drive, it was quite
helpful.... But once I got my STe, CPANEL realized that it couldn't change the
step rate by writing to a specific memory location (which other programs just
went ahead and did). CPANEL ghosted out the stepping rate options!!!

I consider CPANEL a pretty neat DA.

2451. Replacement internal drive for 1040STf ?

Newsgroup: comp.sys.atari.st
Date: 1990-10-07 23:15:38 UTC
From: marks@fquest.fidonet.org
Message-ID: <Rg3oq1w162w@fquest.fidonet.org>
Source record: 238071

I'm looking for information to help me make the right decision. My 18 month old son managed to ruin the original DS/DD 3 1/2 inch drive in my 1040STf, apparently by inserting a disk and pressing down at the same time, resulting in ripping the upper R/W head apart. I'm not sure, but I think its likely that it can't be fixed. Anyway, I'm looking for information to help in replacing it. Like, good or bad experiences with different drives. Like, do any drives from other companies other than Atari work without cutting the case to fit? Like, is there a way to get an exact replacement for a reasonable cost, or am I better off with another companies drive? Like, are there certain drives that allow formatting out to track 90?
You get the general idea, I know next to nothing and feel very uncomfortable being so ignorant on the subject and I really need to decide what to buy before my hard drive fills up totally, heh. Anyway, an information would be appreciated. Or anyone who has an extra drive that they want to sell. I would actally like to get a second external drive at the same time.... Information as to the way to go in getting an external (or building one) would also be helpful. I guess E-mail it to me unless you think the information would be helpful to everyone...]
Thanks in advance...

- Sorry, couldn't afford a signature, I'm saving up for disk drives.. -
---

2452. Patch for Gnu programs under RTX

Newsgroup: comp.sys.atari.st
Date: 1990-10-08 01:59:36 UTC
From: david@doe.utoronto.ca
Message-ID: <1990Oct8.015936.12397@doe.utoronto.ca>
Source record: 238072

A few days ago, I posted my suspicion that it was the freopen()
function which keeps gcc-cpp.ttp from running with MT C-Shell
(under Micro RTX). I still have not seen the gcc-cpp.ttp source,
but I did try out this test program:

```
#include <stdio.h>

main()
{
FILE * fp;

fp = freopen("hack.txt","w",stdout);
if( fp )
fclose(fp);
else
fprintf(stderr,"Cannot open hack.txt\n");
}
```

The program runs under TOS and MiNT, but not under RTX (which prints the
error message). The reason is that the Gnu freopen() function in this case
attempts to close the standard handle associated with stdout, which
(correctly) causes an error under RTX, while TOS and MiNT are a little
more lenient.

NOTE: compress.ttp also suffers from this problem (the one from
atari.archive in atari/gnustuff/tos).

PATCH:

Here is a little patch for the close() function in a compiled GCC 1.37
program. Note that this may not work for you, and may even cause the
program to malfunction! Use with care, and back up your originals. What
the patch does is simply have close() return no error even when there is
one.

Search for the following bytes with your binary editor:

```
3f 3c 00 3e 4e 41 58 4f 34 00 48 c2 6c 0a
|
74
```

Change the byte indicated from 34 to 74 (make sure that the _entire_ string
is correct first). Instead of copying the return value from Fclose() from
a0 to a2, this patch has the function set a2 to 0 (success) in all
circumstances.

MIXED SUCCESS:

compress.ttp does not complain about errors opening files when this patch is applied, but I have not tested it past there.

gcc-cpp.ttp now works with the following command line, which previously failed under RTX:

gcc-cpp hello.c hello.cpp

the result is a file hello.cpp. gcc-cc1.ttp can deal with that file. Unfortunately, using the gcc.ttp driver, there are still problems, and the error message

gcc: cannot open ./cc100000.s

appears (where ./cc100000.s is the output file which gcc-cc1 is supposed to create). I have tried applying this same patch to gcc.ttp, but the problem persists.

GOOD LUCK, and USE WITH CAUTION.

> worked on, has the idea been dropped, etc.? <-- (Fast & Small's)

Dunno about this one, but proVME GmbH (Germany) makes a 030-board with cache memory and "fast ROM". The 16 MHz version seems to be availeble now, 24 and 32 MHz versions are worked on.

To me upgrading the ST does not look like a good choice, if the TT should be real one day; the small bus bandwith of the ST design (slow RAM) could make the TT woth the price.

I noticed that the DTA entry in the basepage is 0x00000000 in TOS 1.4,
which does not seem to be a useful DTA address.

I have absolutely no problem in formating/reading/writing PC and ST
compatible floppies, using the mtools package which was posted to the
net (comp.sources.sun, I believe). I had to add another patch in
order to make the floppies readable under Gulam; Gulam does not seem
to like an all-blanks volume label.

Mtools is not perfect, but I use it very often. I've tried to
contact the author -- but no luck. For those that might
be interested I'll post my private `patch4' here. Just run it through
patch.

2460. Monitor/TV Setup

Newsgroup: comp.sys.atari.st
Date: 1990-10-08 13:46:27 UTC
From: csual@warwick.ac.uk
Message-ID: <1990Oct8.134627.22504@warwick.ac.uk>
Source record: 238082

Thanks to everyone who replied to my question r.e. my STe booting into high res when my monitor was plugged in, when I wanted low/med on my TV.
For anyone who is interested, if pin 4 is low on the monitor port, it boots into high res, otherwise it boots into low/medium. A simple switch on this line will solve the problem, but be careful about using the wrong setting with the wrong screen, as the wrong scan rate could blow it.
Alternatively you can just buy a monitor switch box from any good dealer for ~15 pounds, which routes the output through two separate plugs, thus avoiding any danger.
Thanks again,
Jas.

I know that the Laser C shell is incredibly buggy. I know that Megamax also had a lot of problems with its libraries. I would be surprised here if the problems were in any way MiNT's fault, especially since Laser has had problems even with different TOS versions.

Scrap laser C. There are much better packages available, some of them for free.

Can anyone tell me of any ftp sites with a decent library of Degas format pictures (esp. monochrome) ?
Terminator seems a bit short, and I don't know of any others off hand.

Answers on the back of a postcard to:

csual@uk.ac.warwick.cu

2463. for sale: 1040st - 4meg

Newsgroup: comp.sys.atari.st
Date: 1990-10-08 16:11:51 UTC
From: pr0z+@andrew.cmu.edu
Message-ID: <Ub4_J7G00VpeEU1lxp@andrew.cmu.edu>
Source record: 238081

For sale:

4 meg, 1040 st with color monitor.
megamax C, prospero fortran 77, some pascal, some regular software (vp planner, various word processors, drawing packages), some PD stuff, and some stuff on fractals that I wrote myself for a fortran class.
an okidata color printer (thermal but cute, and the color is okay as long as you don't want to hang the print at the National Gallery)
oh yeah -- and an atari developers kit which is apparently not saleable, but maybe I could toss it in free with purchase of the other stuff and not get in too much trouble. Suffice to say, I won't need it without the machine.

I bought the 1040 when they first came out, but have been at school using the university's hardware since then. Now I'm in grad school and for the next n years, have more computes available then I'll ever use. Regardless, the Atari is not compatible with the school stuff so I can't use both interchangably and I can't afford the line cost to use it as a terminal.

So, now I'm an indigent grad student and my machine sits, alone, unused, and unloved in my brother's basement. Due to time elapsed and a focus on other machines, I'm not even sure what its worth. I'm asking $2000 or best offer for the whole deal. Send offers or discussion of worth, if you wish.

Thanx.

I must whole-heartidly disagree with this. For software
porting, you've got to go gcc/mwc. BUT, for startup
development, you can't beat Laser C. Fast compiling, and
unmatched debugging on the ST.

Yes, it has problems. But like I said, I think it's the
best place for Atari development start to finish.

Joe
ps. I like MiNT too, and wish Laser did run correctly under
it. Oh well.

2467. NeoDesk 3.01

Newsgroup: comp.sys.atari.st
Date: 1990-10-08 18:42:04 UTC
From: pegram@uvm-gen.UUCP
Message-ID: <1684@uvm-gen.UUCP>
Source record: 238088

I just got my copy of NeoDesk 3.01 this weekend, in case you
haven't gotten yours yet, hang on, it's coming soon. First
impressions; lots of new features, on the menus and in the windows.
It's a little overwhelming for now, and I had no luck converting my
old Neodeskm.inf file (like desktop.inf), otherwise everything is fine
so far. If you read your upgrade notice, most of the new things are
described therein. If you got an upgrade, you receive a shortish
upgrade (addendum) to your old manual, which describes the changes.
Some of them seem to have been inspired by the competition - Gemini
and DC desktop e.g. 28 instead of 16 additional icons on the desktop,
and folders can be dragged there too. Desktop folders open a window
to that folder when clicked on. I still have a wish list though, even
if a short one. Gemini's (Venus' actually 8-) two icon sizes and ..
(double dot or place holder for the next directory up) icon would be
nice. I would also like to have display presets (text or icons) set
according to the subdirectory you are entering. This would probably
be relatively easy to do now that the display options are in place
(maybe that's the neodesk program/acc I should attempt). I am really
finding that many of my utility programs, e.g. my auto folder organizer and
FAT zeroing program, are not necessary now, since Neodesk does those
tasks as well or better than the separate programs, and I don't have
to hunt for them or waste accessory space on them.
Really must go now, email questions (helpfull ones would be requests
for tests and/or descriptions of specific features of Neo 3.01) to me,
I will reply on the net or via email as appropriate.

>But I thought this is an "unofficial" way of finding the DTA, so it
>may break someday.

No, this is "official" -- contrary to my earlier posting, it's documented in the original GEMDOS docs, and can't be considered a mistake. (Some things that were documented originally are now considered to have been "mistakenly documented" and are subject to change, but not many, and nothing important. Example: the Getmpb BIOS call should have been documented with "Used internally by GEMDOS" and nothing else.)

>Watching all SETDTA traps, on the other hand, will always work.

This is not the case. Each process starts with a default TPA which is not set via SETDTA. I'm not sure if that default DTA's location is documented, but in all existing TOSes it's the process' command line image, at (basepage+0x80).

No system calls use the DTA except Fsfirst and Fsnext. It is not unlikely that a future GEMDOS might have new calls which accomplish the same thing but don't use the DTA at all, because having system information in user-supplied buffers doesn't make good sense. The DTA and Fsfirst/Fsnext will be maintained for backward compatibility, of course. (And the fact that we have to keep them around guarantees so much cruft in the code that there may not be much point in replacing them. But I digress.)

Bad sectors and the Adaptec.
Bad sectors are mapped in zones on the hard disk. This is why the lights
blink so funny when you turn on an Adaptec based controler.

The whole effect of a bad sector list is to shrink the total size of the
disk. It just seems to shrink a bit more for its internal tables.
The Adpatec has effectively two format commands; short and long.
Short has new bad sectors, long allows passing them as part of the command.

I don't understand all the fuss about mice.

Last time I checked, Atari would send you a new one for a busted one and $25.

If you want a non-Atari mouse, pick up any ST mag (easier said than done) and you'll see ads for dozens of 'em... including high-performance (high price too!) totally optical mice, cordless mice, etc., etc., ad infinitum, ad nauseum...

2473. Tos 1.4 bug?

Newsgroup: comp.sys.atari.st
Date: 1990-10-09 00:03:26 UTC
From: jeff@onion.pdx.com
Message-ID: <1990Oct9.000326.23444@onion.pdx.com>
Source record: 238089

I've been seeing a strange thing with TOS lately. When I try to drag a directory containing a directory called ".bak" to the trashcan, I get a message: "Invalid copy operation". To duplicate it:

(I'm doing this thru GEM, but I'll give unix-like commands :-)

```
cd c\
mkdir junk
cd junk
mkdir .jnk
cd c\
```

Now, try dragging the folder "junk" to the trashcan...

Is this a bug, or something that isn't legal?
On a honest-ta-goodness-IBM-like-ms-dos-machine, it doesn't allow ".jnk" to be created...

If you cd \junk, you can drag ".jnk" to the trashcan with no problems.

Comments? Is there a "formal" way to submit a bug report to Atari?

Well, yes, there are a variety of mice available for the ST. But the Microsoft Mouse IS a very nice mouse, and it would be nice to connect one to the ST. I have not seen a MousePen available for the ST, either. I happen to have one right now. I would like to connect this to my ST. I would hope that the procedure would be similar to connecting the Microsoft mouse. There are just some hardware items that I have not seen for th ST specifically, that I would like to adapt.

Just thought I'd let you know that I received Neodesk 3 today (after ordering it via fax on Friday!) from BRE Software (209-432-3072, there's a toll-free number too). $41.95, $2 discount for faxing order (209-432-2599). Great service, the manual is _extensive_, things look great so far. Seems to offer the best features of Gemini without requiring GDOS or hogging so much memory, and has some other great features as well, including one-key program execution ala Hotwire.

2477. HELP WITH NEODESK 3.01

Newsgroup: comp.sys.atari.st
Date: 1990-10-09 08:51:14 UTC
From: rfschaa@cs.vu.nl
Message-ID: <7865@star.cs.vu.nl>
Source record: 238099

Last week I received my update to NeoDesk 3.01 from Gribnif. I tried to
get it running but all my attempts were in vain. Sometimes I got to
the NeoDesk desktop, but after some time I got 2 bombs and the system hang.

After trying everything I could think of, I conclude that there must be
some error in the NEOLOAD.PRG file. This error might be a bug, or something
that has happened to it during shipping.

My question now is: could someone please send me a copy of the NEOLOAD.PRG
file. I do not think this is illegal, because I would be unable to use
it unless I already have the rest of the package.

If someone out there has NeoDesk 3.01 but does not want to send a copy of
NEOLOAD.PRG, then PLEASE send me : 1. The length of the file in bytes
2. Some kind of checksum,
so I can check if my copy of NEOLOAD.PRG is indeed corrupted.

You might say I could write to Gribnif directly, but it takes about 10 weeks
to get an answer back (I tried it once before).

Richard Schaaf (<rfschaa@cs.vu.nl>).

2478. Looking for original gulam.docs (texinfo ????)

2479. Re: Laser C V2.1 vs MiNT??

Newsgroup: comp.sys.atari.st
Date: 1990-10-09 10:17:45 UTC
From: kentd@FtCollins.NCR.com
Message-ID: <KENTD.90Oct9111745@zappa.FtCollins.NCR.com>
Source record: 238093

>I know that the Laser C shell is incredibly buggy. I know that Megamax
>also had a lot of problems with its libraries. I would be surprised here
>if the problems were in any way MiNT's fault, especially since Laser
>has had problems even with different TOS versions.

I don't use the Laser shell so I've never noticed it's bugs...
Admittedly, Laser definitely has its problems but I've discovered
workarounds for all the library bugs I've seen, to this point.

It does have its good points: excellent docs, speed, a very nice
source code debugger, inline assembly, I got it used for like ~$80
below the average purchase price :^), etc.

But enough about Laser C. I think incompatibility with Laser C programs
(not necessarily the compiler itself) would be a serious hinderance to
MiNT? I'm sure a lot of stuff available out there PD and commercially
has been written using Laser C and hence MiNT will have a lot of
problems running this stuff.

>Scrap laser C. There are much better packages available, some of them
>for free.

Thanks for the advice.

In my eyes, MiNT has a lot of potential as a TOS replacement since it
has so many nice UNIX inspired features and still offers a degree of
compatibility and if that compatibility can be maximized while adding
the features people want everyone will be happier in the long run. So, I
think the best long-term plan is to get Laser and MiNT working together
at least stuff compiled with Laser, if not the actual compiler.

I'm willing to look into the Laser/MiNT compatibiity issue myself and if
any other Laser users have advice suggestions, want to help, already
have done some research, etc, let me know.

Also, Eric Smith, if you have any ideas on what's happening please say
so.

Here's a little additional info for those interested:

When in debug mode, MiNT shows Laser Programs malloc'ing 8K (presumably
stack), it then tries to grab some more mem and gets a message to the
effect of: get_region, no region is big enough or some such.

2480. New applications-oriented ST mag to appear in UK

Newsgroup: comp.sys.atari.st
Date: 1990-10-09 10:59:19 UTC
From: grahamt@syma.sussex.ac.uk
Message-ID: <3593@syma.sussex.ac.uk>
Source record: 238020

Someone recently asked about ST journals & mags with an applications and programming bias. There was some discussion on the demise of the UK mag ST World. (Sorry, demise is not correct - the mag has gone quarterly and now consists mainly of comparative reviews and 'buyers guides'.)

Well, the gap may be about to be filled by a new publication: ST Applications. It's being launched by Paul Glover, who runs the 'ST Club' (newsletter, disk mag and PD software library) and who has recently become the UK correspondent for Z*Net mag.

The ST Club newsletter is due to turn into ST Applications in November. The exact format is not yet fixed, and potential contributors are currently being solicited for their views & ideas, but the intention is to have a mix of reviews and articles on all sorts of application areas, as well as coverage of the ST scene worldwide. While the aim is to produce a more professional magazine, Paul & co (David Smith, design; Niki Wilson, admin) don't want to lose the 'user-driven' feel of the ST Club newsletter. They're after ideas for submissions. Authors will be paid, though not extravagantly.

The first print run will be around 12,000 copies, and the magazine will have at least 45 pages of editorial material.

Further information can be obtained from Paul Glover, ST Club, 49 Stoney Street, Nottingham, NG1 1LX, UK. Tel: +44 602 410241.

Graham Thomas (just an ST Club member)

2481. Re: A disk-based magazine for the ST. Any Suggestions?

2485. Re: Any hardware hacks anyone ?

Newsgroup: comp.sys.atari.st
Date: 1990-10-09 14:29:16 UTC
From: bointon@kcl-cs.UUCP
Message-ID: <1192@xenon.kcl-cs.UUCP>
Source record: 238096

Hardware hacks??? There are loads!!
You are a little behind- Doubling the processor speed was done ages ago (2yrs?)
The leading exponent of the hardware hack is Dave Small (of GCR etc). There are many producers of 16MHz boards of varying complexity. The best option seems to be 16Mhz 68000 with 68882 (16MHz), fast ROMs and 16K cache. Gadgets by small reportedly have a 16MHz 68030 board (Hypercache '030??) on the way...

A favourite hack for the end user is the overscan mod. This involves the addition of 4 wires, a switch, and the cutting of 2 circuit board tracks, the end result of which is an increase in resolution up to about 800*500 in mono! This would require a multisync, but an SM124 can be pushed to about 750*600! Thankfully, most well behaved applications adjust themselves to fit the big screen (though the switch allows the circuit to be returned to normal, should it be required)

Other hacks: There are numerous Hacked versions of TOS available from Germany that have bugs removed and new features added. I have seen a multisync board for the SM124 which allows all resolutions to run on it (with grey scales), and it's only 50 pounds! (buy it now while the exchange rate is good!)

If there is demand, I could be persuaded to post overscan details to comp.binaries.atari.st...

Your suggestion of refitting the ST into a bigger box is already well established (see last issues of ST World and ST Club newsletter).

From: rost@aqua.dec.com
Message-ID: <3110@ryn.esg.dec.com>
Source record: 238013

Welcome to Atari-land time...

I'm looking to get a hold of a copy of "First Shapes", a children's package from First Byte. This package has been highly regarded since it came out, so of course, Electronic Arts, who markets First Byte has dropped it in the Atari format. The mail order places that advertise it in START of course don't have it and can't order it.

If anyone has a copy of this that would be willing to sell, trade, swap, whatever, please e-mail me.

Thanks!!!!

Brian Rost @aqua.dec.com

2487. Re: NeoDesk 3.01

Newsgroup: comp.sys.atari.st
Date: 1990-10-09 16:52:34 UTC
From: bill@mwca.UUCP
Message-ID: <1720@mwca.UUCP>
Source record: 238097

In article <1684@uvm-gen.UUCP> pegram@uvm-gen.UUCP (Robert B. Pegram) writes:
>
> I just got my copy of NeoDesk 3.01 this weekend...
>I had no luck converting my old Neodeskm.inf file...

Me neither. Perhaps a bug (feature?) slipped through?

>Gemini's (Venus' actually 8-) two icon sizes and ... would be nice...

I agree. However, Neodesk's Icon Editor is _very_ full featured, and you
can create smaller icons to give you more room on the desktop. Also, the
editor can read .RSC files as well as .NIC files for grabbing new icons.

Other observations: The manual (~140 pages for the non-upgrade version)
states that if an alternate text file reader is used Neodesk won't unload
itself from memory when calling the reader. However, I chose Quick View
(from Quick Tools) as my file reader but Neodesk still unloads itself
before executing it. Also, the environment from Neodesk is not recognized
by Quick CLI/Quick Env, and vice versa. I've still been unable to get
Quick Tools to autoload an environment upon booting...shouldn't the TOS
environment be accessible by all programs?

Another nice feature is that most/all operations can be performed on
windows which aren't on top - GEM won't allow resizing, backing up a
level, or closing a window which isn't on top, but Neodesk will allow
any action to be performed as long as the button/file/folder is visible.

Neodesk only uses up 35K when executing other programs, which is a very
small price to pay - Gemini gobbles ~200K, plus generally requires that
GDOS be resident.

All in all, a _very_ nice package.

Thanx for all the input:

4 meg, 1040 st with color monitor.
megamax C,
prospero fortran 77,
some pascal,
some regular software (vp planner, various word processors, drawing packages),

some PD stuff,
an okidata color printer (thermal but cute, and the color is okay as
long as you don't want to hang the print at the National Gallery)

oh yeah -- and an atari developers kit which is apparently not saleable,
but maybe I could toss it in free with purchase of the other stuff and
not get in too much trouble. Suffice to say, I won't need it without the
machine.

make an offer for all or parts.

Message-ID: <1990Oct9.191528.932@agate.berkeley.edu>
Source record: 238019

First, you need a HOST ADAPTER. They are available from ICD, BMS of
Oakland (see the phone book), and Supra.

Second, to connect the Mac, you need a 50pin SCSI to Centronics cable.
They seem to be easy to make, but you can buy one from Supra.

Look at spending near $150 to connet the Mac drive.

Forget about the floppy unless you are a hardware engineer.

Just discovered how to trick Uniterm into doing something I've been trying for a while. It is possible to get Uniterm to pause the screen update, while continuing to receive data (thus allowing quick reading of paged data even at low baud rates). This works great if you use a paged notes viewer or some other paged text viewer. The Uniterm ALT-Z holds only the screen updata (if you have enough buffer room to keep receiving data). If you _very_ quickly hit space (or whatever key is next page on your viewer) then immediately (real quick) hit ALT-Z, you can beat the Terminal to the screen clear code (that is if your viewer clears the screen like mine between pages). When you finish reading the page that is held on the screen, hit ALT-Z and magically a new screen of data will pop up (instantly - not at slow baud rate). Repeat. Serve and enjoy.

Just me marveling at a dumb terminal trick (better than a dumb bar trick)...

>net (comp.sources.sun, I believe). I had to add another patch in
>order to make the floppies readable under Gulam; Gulam does not seem
>to like an all-blanks volume label.

There are three possible problems some people may encounter:

1) Minor problem: To compile, I had to change the source to rename a type to "union __wait" in the function formatit in file "mkdfs.c": some include file dependency no doubt.

2) MAJOR PROBLEM: as distributed, init.o *must* be compiled with DUP_FAT defined. (I believe your patch fixes that, but I can't read patch myself :-). I made DUP_FAT the default in my version: My Atari needed the second FAT to read disks correctly. Why leave some machines out?

3) Medium problem? : Just like MSDOS machines, these programs don't write a disk serial number like Ataris want. Your problem with Gulam may be related to that somehow: no serial number, and Ataris get confused as to when they need to re-read the disk FAT: all disks look alike. (But the volume label is a file, not in the boot sector banner where the serial number goes, so I am not sure this is your problem. I'll try gulam tonight to see if my version works OK.) Hitting <esc> rereads disks in which I have written serial numbers, so I think it is OK - I didn't have real good docs when I wrote this patch.

Source record: 238023

mts10271@uxa.cso.uiuc.edu writes:
> Does anyone know what is going on with the 68030 board that
> was mentioned for the Mega's a while ago. Is it still being
> worked on, has the idea been dropped, etc.? <-- (Fast & Small's)

I was at the WAACE AtariFest last weekend. It was a great time.
FAST TECHNOLOGY was there demonstrating their 68030 MEGA ST upgrade
board. I'm not sure if it is for sale yet, but I did see one...

... He's definately working on it... and it did seem to work...

In a related story, ICD was at the WAACE show with their new
16 Mhz upgrade. WOW it was compact! Seems to be neat. They were
taking advanced orders for it. Said it was being tested in the field,
and that the first shippment will be going out in a few weeks!

Also, GADGETS BY SMALL was at the ATARIFEST with their TT!!

So was DOUBLE CLICK SOFTWARE!! (needless to say I had my
picture taken next to a TT. If you can't own one, at least you can
capture the memories!)

These two machines were the older developers 16 Mhz machines...
ICD claimed to have a 32Mhz TT from Germany... (they didn't have it at
the show).

Later,
Jim Tauberg

2501. PACK-ICE

Newsgroup: comp.sys.atari.st
Date: 1990-10-10 03:46:07 UTC
From: jlong@radc.af.mil
Message-ID: <jlong.655530367@cassiopeia>
Source record: 238015

I have tried the newly posted Pack-Ice, and while it does seem to work very well, IT IS VERY SLOW! We are talking 30 minutes to pack WordPerfect! Still, it does do an excellent job, and has not balked at packing any program I give it.

If anyone else has used this, is it my imagination, or does a pack-iced program take a tad longer to load and run than the same program packed with packer? Is it the unpacking header that takes longer since this program seems to do a more complete compression of the executable?

>
> atari@atari.archive.umich.edu
> and
> atari@terminator.cc.umich.edu
>
>but received the 3-day notice with both. Any suggestions?

mailrus is one of our uucp gateway machines. it has suffered a disk crash
and hasn't been answering the door lately... However, uunet should not have
to rely on mailrus to get mail thru to atari.archive. You might try sending
your uucp mail to uunet!atari.archive.umich.edu!atari, though I'm not sure
that it will give a different result at uunet, given the behavior you cite.

Of course, now that I think of it, even if you *can* get the message thru,
uunet will probably rewrite the header to say from user@host.uucp, and
the mailer at atari.archive will try to send to mailrus to get it forwarded.
Oh well... No good suggestions for the moment.

2503. Re: Looking for "First Shapes"

Newsgroup: comp.sys.atari.st
Date: 1990-10-10 12:38:20 UTC
From: rost@aqua.dec.com
Message-ID: <3131@ryn.esg.dec.com>
Source record: 238027

I'd like to thank all that responded to my posting. I've located a copy of "First Shapes".

For those who might be in a similar situation, here's the story that I unravelled after some time on the phone:

Electronic Arts used to distribute First Byte, but that relationship terminated some time ago. Dealers who only know of FB through EA therefore consider the titles "out of print". Meanwhile FB has liscenced a company called SmartWorks to sell their stuff, both to home and school users, but SmartWorks will only be handling IBM-PC format. It turns out that you can order titles directly from FB. The info in the Oct. 1990 START article on educational software incorrectly gives the phone and address to EA, rather than FB. At some point in the future, delears may actually be able to get ahold of the packages again, in the meantime you'll need to call FB direct to order.

From: rost@aqua.dec.com
Message-ID: <3132@ryn.esg.dec.com>
Source record: 238028
Cross-posted to: rec.music.synth,comp.sys.atari.st

Hi!

I'm looking for a PD patch editor for the Ensoniq ESQ-1 and SQ-80 synthesizers that runs on an Atari ST. I already have a librarian called ESQuizit but would like something that allows editing patches, in particular with graphic envelopes. I'll likely end up buying a commercial editor eventually, but right now my budget is tight ($0).

I already checked the panarthea and terminator archives and couldn't find anything.

Thanks in advance.

2506. Using ZOO to backup and restore/create relative subdirectories

Newsgroup: comp.sys.atari.st
Date: 1990-10-10 14:36:38 UTC
From: steve@thelake.mn.org
Message-ID: <A1284707658@thelake.mn.org>
Source record: 238042
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

There have been a couple of (unanswered, I think) questions lately about how to use zoo.ttp to automatically archive subdirectories and to automatically create subdirectories relative to the current directory when unpacking files.

There are two so-called "novice" commands to do this. They are not explained in the helpscreen that appears when you run "zoo h".

The commands are:

zoo -backup file.zoo *.*
This packs everything in the current directory and all relative subdirectories, preserving the (relative) path information.
^^
zoo -restore file.zoo
This explodes an archive, creating any necessary subdirectories relative to the current working directory.
^^

I'm told that an early version of zoo fails to perform these operations properly on the ST. The version I have that works includes the following header. Check the date and time:

Zoo archiver, Version 2.01STg (1988/08/25 12:43:57)
(C) Copyright 1988 Rahul Dhesi -- Noncommercial use permitted
Atari ST version by Daan Josephus Jitta (1989/05/31 21:21:41)
Usage: zoo {acDeglLPTuUvx}[aAcCdEfInmMNoOpPqu1:/.@n] archive file
("zoo h" for help)

>on TOS 1.2. If not, you can try HEADSTART. HEADSTART works better
>than STARTGEM anyway. If it's not on atari.archive, let me know and
>I'll send it.

I haven't tried it yet, but the HEADSTART documentation claims it
doesn't work with Rainbow TOS (1.4).

Perhaps I didn't explain what I want well enough.
Let's say I have a wonderful program that I want to give to
someone and want to have it auto boot. If I know the person
will always use TOS 1.4 I can set up the entry in the desktop file.
If I know he will always use TOS 1.2, I can set up the STARTGEM
program. If I know he will always use ... .
The point is, I don't know what he will always use, because "he"
might be different people with different systems.

What I need is a single auto folder program that can determine
the current version of the OS and do the appropriate thing.
It seems rather silly for me to write a large program that runs
portably on all known versions and then have to make different
disks for each OS simply in order to get it to auto boot.

2509. Neodesk 3 incompatibility

Newsgroup: comp.sys.atari.st

From: bill@mwca.UUCP
Message-ID: <1724@mwca.UUCP>
Source record: 238033

I've found my first apparent incompatibility with Neodesk 3: Pressing the left mouse button in Uniterm (for the cut/add/send menu) yields two bombs, a dump back to the Neodesk register screen, back to the Neodesk desktop, then three bombs and a lock-up. Definitely repeatable, doesn't happen with the same combination of auto programs/accessories without Neodesk.

Message-ID: <4757MV010320@NDSUVM1>
Source record: 238034

Okay here's my situation,
I want to know if it is possible to download programs for the ST
using an IBM XT. Both using a 3.5 drive. Would I have to Format disks on my
ST and then try to download onto them using the XT or wouldn't it matter or
is it even possible to pull this off? Thanks for any help that I get.
My situation is that I am in North Dakota with NO ST BBS support and I have a
friend down in Milwaukee that has quite a few ST BBS's to choose from and what
I'd like him to do is to download some of this stuff for me. Problem is that
he has no ST. He has an IBM XT with a 3.5 drive. Can he in any way download
stuff for me using his XT???
Thanks,

Thomas

The NeXT configuration you mention (I assume it's the "pizza" box) comes with
a limited software bundle. Among the things left out are the LISP and C
languages. It also includes only the 160 MB hard disk, of which only
30 MB is available after the OS is loaded on it. In addition, this box
is not upgradable, other than through the ports. You can't even upgrade
it to color.

Source record: 238036

The computer store where I used to work always did the same with no problems for many years (starting the computer, monitor, printer, ... straight from the surge protector switch).
The owner said that he's seen switches on machines go bad, so this takes the stress off the individual switches.

On the other hand, I just don't quite trust this method with my ST; so I do all but the computer.

I've read in several places that it's not good to plug in a printer to the ST when it's on; there's no buffering on the printer lines. I imagine this also applies to turning printers on with the ST powered up; them surges is nasty little critters!

WANTED: ST COLOR MONITOR FOR DONATION TO PRIVATE GRADE SCHOOL.

>it to color.

The NextStation at any price includes a license for _all_ NeXT bundled
software. The small disk version has 30+ MB _after_ various applications
are already on the disk, such as WriteNow. The NextStation _is_ upgradable
in a couple of important ways...disk space and memory. Simms can be added
later, and external SCSI drives can be used. With the added disk space
University users can obtain, usually at their campus computer store or
through the academic computing organization, copies of any NeXT software
they want for use on their external drive.

So for the frugal, the best bang for the buck is to buy a minimal
NextStation, and then add 3rd party memory and disk drives, and then add
the entire base of NeXT software.

Phil

No problem. Just have your frind format the disks with his XT (make sure
he formats them _double_ density -> 720K, assuming you have a DS drive).
The ST can read any IBM-formatted 3.5 disk except the high density ones.

If you have a modem for your ST and have ftp access you can get a lot
of good PD/Shareware software that way. If so (or if you're not sure) read
the monthly posting of 'frequently asked questions' here or contact me by
e-mail directly and I'll try to help...

>is not upgradable, other than through the ports. You can't even upgrade
>it to color.
>

It costs relatively little considering that Mathematica($800) and a spread-
sheet and a word processor are included. There IS a C included, Objective C,
and C++ (probably G++). TeX too. You can probably add a SCSI disk for
relatively little money.

On the minus side, it has only 8MB ram. Most of the old bundled stuff (Frame
Maker, Shakespeare, the optical drive) is missing.

I think it's a good deal because it kicks serious ass over similarly priced
and loaded PCs and Macs. And Ataris and Commodores.

2522. Ideas on how to get software to Atari ST

Newsgroup: comp.sys.atari.st
Date: 1990-10-11 02:27:32 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <8975@helios.TAMU.EDU>
Source record: 238039

Thanks to everyone that helped me on my problems getting my files back to my Atari ST from the mainframe. Here is what worked.

I put the the kermit file server in binary mode doing the following:

```
$ kermit
ckermit> set file type binary
ckermit> server
```

And then putting the Uniterm program in kermit server mode.
First:

I had to go to the setup mode and make sure that I was using CRC error checking. THen I also bumped up the packet size to 1000 (not necessary but really convenient).

Next:

Control-T
Click on binary mode.
Click on the rest of the menus for whatever I want to do.

This only worked under UNIX. I tested it under HP UX and Amdahls UTS. It worked fine under those, but I never got it to work on the VAX runnig VMS no matter what suggestions that I tried.

I reveice about 30 suggestions and about 10 of them suggested the above. Thanks to everyone who helped.

> and
> atari@terminator.cc.umich.edu
>
>but received the 3-day notice with both. Any suggestions?

I have also had trouble "ftp"ing from the atari.archive.umich.edu
archive. I always get "connection refused". I thiugh that the problem
was local, but I can ping the atari.archive.umich.edu machine showing the
the connection is active and that I should be able to ftp from the archive.
I think that the atari.archive.umich.edu machine is refusing the ftp connection
due to a UNIX permissions problem or something like that.

2524. Dcstuffer

Newsgroup: comp.sys.atari.st
Date: 1990-10-11 03:51:37 UTC
From: marshall@batserver.cs.uq.oz.au
Message-ID: <5183@uqcspe.cs.uq.oz.au>
Source record: 238043

I obtained DCstuf09 from panarthea archives. I put all my *.acc's into a
folder called stuffer in my C h/disk root directory. I renamed all the
*.acc's which were in the root directory, to *.ac1. Only DCstufer.acc was
enabled at root level. I also had stinit.prg (in my auto folder).
I cold re-booted, and selected DCstuffer from the stinit menu.
When DCstuffer ran, it displayed VERY quickly a few acc's, and then bombed.
Is it sensitive to the order of the acc's? Or what have I done wrong?
I have TOS1.0 :-(
Or is DCstuffer incompatible with stinit ('twould be a pity, since it is
nice to be able to select what prg's should run from the auto folder).
Thanks in advance.

2525. High density 3-1/2" disks

Newsgroup: comp.sys.atari.st
Date: 1990-10-11 04:13:45 UTC
From: handy@trou51.enet.dec.com
Message-ID: <1962@mountn.dec.com>
Source record: 237959

I have managed to purchase two new 3-1/2" floppy disk drives for my
Atari 1040STf. I don't know if the disk drives are high density or not, but
they were manufactured by Mitsubishi and Chinon in December 1988.

What is the best way for get them to work with my ST? I have the old TOS
installed. Does TOS 1.4 support high density diskettes?

Much appreciated

Lyndon Handy

I agree that the configuration comes with some useful software, but you still don't get the full software bundle. You have to get the software copied yourself, even if you do get the license.

>So for the frugal, the best bang for the buck is to buy a minimal
>NextStation, and then add 3rd party memory and disk drives, and then add

Third party memory might be fairly easy, but I've yet to hear from someone who has successfully attached a third party hard disk to a NeXT. There are some horror stories floating around about people who tried to attach third party hard disks to cubes

2527. Re: PACK-ICE

Newsgroup: comp.sys.atari.st
Date: 1990-10-11 12:14:45 UTC
From: jeroen@plato.phil.ruu.nl
Message-ID: <791@accucx.cc.ruu.nl>
Source record: 237960

In article <jlong.655530367@cassiopeia>, jlong@radc.af.mil (Jeff Long) writes:
|>I have tried the newly posted Pack-Ice, and while it does seem to work
|>very well, IT IS VERY SLOW! We are talking 30 minutes to pack WordPerfect!
|>Still, it does do an excellent job, and has not balked at packing any program
|>I give it.
|>
|>If anyone else has used this, is it my imagination, or does a pack-iced
|>program take a tad longer to load and run than the same program packed with
|>packer? Is it the unpacking header that takes longer since this program seemsople
complete compression of the executable?

I have compared two packers recently, pack-ice and pfxpack: yes, pack-ice is *SLread
about 90 minutes...). That would not be too bad if only it were
sufficiently fast at runtime unpacking the program: again, gcc_cc1 takes about 2ot t
unpack.
The average packing rate I have experienced with pack-ice is about 50-60%. This comp
good.

pfxpack took 'only' about 10 minutes to pack gcc_cc1; runtime unpacking is only
(tops). The compression rate is about 50% on average, only slightly
worse than pack-ice.

Now if only pack-ice would allow UNPACKING the programs it packs, it would still
keep pack-iced programs as working backups; but I have not yet
found a way to unpack pack-iced things.
Irritating too is pack-ices habit of always writing the compressed program over
the original, and, since there is no way of restoring the original from the
compressed program, this may be desastrous if you're not thoughtful enough alway
before you run pack-ice.

pfxpack can unpack its compressed programs; it will not try to compress programs
compressed; it allows to write the compressed program to a different
file. Furthermore, pfxpacked programs are even supposed to be extractable by
lharc (although I have not tried this, since pfxpack does this quite well itself
people to use pfxpack instead of pack_ice, until pack-ice speeds up
and is changed to make restorable compressed programs.

One last remark: Calamus will give you nasty messages if it is compressed
It will tell you the program is probably infected by a virus, since
the program length has changed, and it will tel you it is probably infected
by a virus, since the program header has changed (this one you also get
if you set the fastload bit in the program header ... tsk, tsk).

Hope to have been of any help, J.

>he has no ST. He has an IBM XT with a 3.5 drive. Can he in any way download
>stuff for me using his XT???
> Thanks,

The Atari can understand the IBM format but I believe the IBM won't
understand the Atari format. There are two possible solutions:

1. Format the disks on your Atari using a PS/2 format utility. (There
is at least one of these and possibly more than one available on
the net.)

2. Format the disks on the IBM. When you do this you MUST make
sure that you are formatting in the low density (~720K) instead
of the high density (~1.4meg). This is done by specifying a
couple of flags in the format command (see the DOS manual for
details).

I have used both of these solutions and can say that they both work.
For solution 1 I use a utility called `ps2form' which I got from
the network. For solution 2 I have done it from a PS/2 model 30
and from a SparcStation 1+ running a DOS emulator. (I've never
tried it from an XT but I don't see why it wouldn't work.)

>The NeXT configuration you mention (I assume it's the "pizza" box) comes with
>a limited software bundle. Among the things left out are the LISP and C
>languages.

Wrongo! I don't know about LISP but All NeXT machines are shipped with C
standard(with Objective C extensions and a very nice Interface Builder
(resource construction set)) As for your claim of a limited software
bundle, in addition to real UNIX and a host of utilities you get a
professional word processor(WriteNow), the complete digital Webster
Dictionary, NeXTmail mail system, Lotus IMPROV spreadsheet, and if you
buy through the educational program you get Mathematica! Now compare that
to what you get with a TOS machine: Atari Basic - BFD. The hardware
superiority of the NeXT machine is beyond debate.

2531. WAACE AtariFest Questionaire

Newsgroup: comp.sys.atari.st
Date: 1990-10-11 16:08:18 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1990Oct11.160818.3886@terminator.cc.umich.edu>
Source record: 238046

[I am posting this for John Barnes. Please give him your feedback, not me.
Reply to johnbarnes@enh.nist.gov, or post to the net. Thanks, weiner]

Feedback on WAACE Show

A number of people people from Netland attended the WAACE
AtariFest, held on 6 and 7 October 1990. There were approximately 34
vendors and a number of other developers who presented new products in
demonstration rooms and seminars.

The event was held in a hotel in suburban Reston, VA. A number
of vendor types stated that the show was better than the World of
Atari in Anaheim and others felt that it surpassed the combined
Glendale and San Jose shows as far as the volume of business that the
vendors did.

The organizers of the show would appreciate feedback on the
following points:

1). Did you find the show worthwhile?
2). Did you find the show too costly?
3). Was there an adequate information content?
4). Did you experience any operational rough spots?
5). Which seminars or demos did you like best?

This was the seventh effort put together by the WAACE team, but
it was the first one to use a hotel setting. Each new edition
presents its own problems, but it is nice to get input from users to
help make the next production better.

The WAACE group will be evaluating the feasibility of and the
format for a possible 1991 event over the next few weeks.

You may post the feedback answers publicly if you wish or you
may e-mail them to johnbarnes@enh.nist.gov.

Message-ID: <12628993498028@osu-20.ircc.ohio-state.edu>
Source record: 237951

It appears my original attempt to sell my Mega-4 system as a system was a bust.
Everyone wants pieces parts. And we all know that "parts is parts".
So, I have the following pieces parts for sale:

Mega ST-4 w/TOS 1.4 and Tweety board $875

SLM-804 Laser Printer $700

UltraScript (P/S 35 - 7 font families) $250

Timeworks DTP Software (Publisher ST) $ 50

Breech $ 10

Dungeon Master $ 10

Empire $ 10

Atari SM124 Mono Monitor $ 75

Items will be shipped UPS COD - we'll split shipping on items > $100, you
pay on items < $100.

Your ST can read a disk that was formated on the PC as long as it's not
high density (1.4M) which it probably isn't since it's an XT. The PC
can read a disk formated on the ST only if you've used a formater that
puts the DOS boot sector on the disk. DCFormat will do this for you.

Yep, it's no problem, I do it all the time. Just format the 3.5"
floppies on the IBM (or format them on the ST and add an IBM boot sector
with the appropriate boot-sector-adding software). If his IBM has a
1.44 Meg (high density) 3.5" drive, make sure he formats the floppies to
720K (double density). Then download the files just like any other IBM
file. I have access to IBM's at work with ethernet connections, so I
download very quickly there, and then take the disks home to my ST and
I'm ready to go. Hope this helps.
Be seeing you...

The 68040 (when it's out) is very nice. Running at 25 MHz (standard NeXT
speed), it'll be 2-3 times as fast as (I hate it when people say X times
faster than) a 68030 running at 32 MHz with a 68882. Then there's that
Motorola DSP chip that everyone's been drooling over for a while now.

First of all: that was with the _CUBE_ configuration. Second: doesn't
that remark sound at all familiar? Think back 4-5 years ago: "The Atari ST
is just not expandable... you can't even plug in a 3rd party hard disk!".

You gotta give it a chance. Steve Jobs is well known for making big
comebacks... made the Apple III, flopped, then success with the IIe. The
same story with the Lisa, the Mac's ill-fated predecessor. Now it is the
NeXT, the original cube was considered a nice idea but not all that well
implemented... too ambitious for the market, not to mention too expensive
(just like the Lisa!). Now he's coming back with a couple of improved
designs, and I for one will keep an open eye on the new NeXT systems...

Still, it's a very good value for money. Remember, it comes with 040,
which is suppose to be quite a bit faster than the previous 030 based
'cubes'. In any case, I think most of these machines will be bought by
the schools who will certainly connect them to their network, so small
free HD space is not a problem...

>>stuff for me using his XT???
>> Thanks,

>The Atari can understand the IBM format but I believe the IBM won't
>understand the Atari format. There are two possible solutions:

After reading this, something form MY experiences:

I have a Mega ST with TOS1.4 now. When I format a disk from the desktop all our PCs, XT's and AT's and whatnot IBM clones can read that disk and write on it. If I copy ST files onto the disk as well, the PC can read those so I can downlowd stuff to our UNIX machines that way.

The other way around also works: Formatting disks on the IBM clone (using format b: /t:80 /n:9 because otherwise the drive usually tries HD format) and copying files from our UNIX machines onto them allows me to take home stuff which the Atari reads without problems.

Gist of the matter: I don't need to use ANY conversion programs and get by with the standard utilities supplied by the operating systems. Where's your problem.

If you have an orlder TOS, you will run into problems trying to read ST formatted disks on a PC. I never had problems reading PC formatted disks on my ST, even back in the TOS1.2 days!

Maybe this helps you, maybe it doesn't. Just take it as information.

So long,
Martin

2546. The ABC programming language

Newsgroup: comp.sys.atari.st
Date: 1990-10-12 12:13:20 UTC
From: steven@cwi.nl
Message-ID: <2328@charon.cwi.nl>
Source record: 237969
Cross-posted to: comp.lang.misc,comp.sys.atari.st,comp.sys.ibm.pc.misc

A mailing list has been formed for discussions about the programming language ABC.

If you'd like to join, please send a message, including your preferred email address, to
abc-list-request@cwi.nl

To submit articles, you can send them to
abc-list@cwi.nl

Steven Pemberton, abc-list administriviator, steven@cwi.nl

WHAT IS ABC
This is a quick overview of the programming language ABC and its implementations, and gives a few examples of ABC programs. Full documentation about ABC is in the ABC Programmer's Handbook (details below).

THE LANGUAGE
ABC is an imperative language originally designed as a replacement for BASIC: interactive, very easy to learn, but structured, high-level, and easy to use. ABC has been designed iteratively, and the present version is the 4th iteration. The previous versions were called B (not to be confused with the predecessor of C).

It is suitable for general everyday programming, the sort of programming that you would use BASIC, Pascal, or AWK for. It is not a systems-programming language. It is an excellent teaching language, and because it is interactive, excellent for prototyping. It is much faster than 'bc' for doing quick calculations.

ABC programs are typically very compact, around a quarter to a fifth the size of the equivalent Pascal or C program. However, this is not at the cost of readability, on the contrary in fact (see the examples below).

ABC is simple to learn due to the small number of types in the language (five). If you already know Pascal or something similar you can learn the whole language in an hour or so. It is easy to use because the data-types are very high-level.

The five types are:
numbers: unbounded length, with exact arithmetic the rule
texts (strings): also unbounded length
compounds: records without field names
lists: sorted collections of any one type of items (bags or multi-sets)

tables: generalised arrays with any one type of keys, any one type
of items (finite mappings).

THE ENVIRONMENT
The implementation includes a programming environment that makes
producing programs very much easier, since it knows a lot about the
language, and can therefore do much of the work for you. For instance,
if you type a W, the system suggests a command completion for you:
W?RITE ?

If that is what you want, you press [tab], and carry on typing the
expression; if you wanted WHILE, you type an H, and the system changes
the suggestion to match:
WH?ILE ?:

This mechanism works for commands you define yourself too. Similarly,
if you type an open bracket or quote, you get the closing bracket or
quote for free. You can ignore the suggestions if you want, and just
type the commands full out.

There is support for workspaces for developing different programs.
Within each workspace variables are persistent, so that if you stop
using ABC and come back later, your variables are still there as you
left them. This obviates the need for file-handling facilities: there
is no conceptual difference between a variable and a file in ABC.

The language is strongly-typed, but without declarations. Types are
determined from context.

EXAMPLES
The (second) best way to appreciate the power of ABC is to see some
examples (the first is to use it). In what follows, >>> is the
prompt from ABC:

NUMBERS
```
>>> WRITE 2**1000
10715086071862673209484250490600018105614048117055336074437503883703510511249361224931983788156958581275946729175531468251871452856923140435984577574698574803934567774824230985421074605062371141877954182153046474983581941267398767559165543946077062914571196477686542167660429831652624386837205668069376

>>> PUT 1/(2**1000) IN x

```

TEXTS
```
>>> PUT ("ha " ^^ 3) ^ ("ho " ^^ 3) IN laugh
>>> WRITE laugh
```

```
ha ha ha ho ho ho

>>> WRITE #laugh
18

>>> PUT "Hello! "^^1000 IN greeting
>>> WRITE #greeting
7000

LISTS
>>> WRITE {1..10}
{1; 2; 3; 4; 5; 6; 7; 8; 9; 10}
>>> PUT {1..10} IN l
>>> REMOVE 5 FROM l
>>> INSERT pi IN l
>>> WRITE l
{1; 2; 3; 3.141592653589793; 4; 6; 7; 8; 9; 10}

>>> PUT {} IN ll
>>> FOR i IN {1..3}:
INSERT {1..i} IN ll
>>> WRITE ll
{{1}; {1; 2}; {1; 2; 3}}
>>> FOR l IN ll:
WRITE l /
{1}
{1; 2}
{1; 2; 3}
>>> WRITE #ll
3

COMPOUNDS
>>> PUT ("Square root of 2", root 2) IN c
>>> WRITE c
("Square root of 2", 1.414213562373095)
>>> PUT c IN name, value
>>> WRITE name
Square root of 2
>>> WRITE value
1.414213562373095

A TELEPHONE LIST
This uses the table data-type. In use, tables resemble arrays:

>>> PUT {} IN tel
>>> PUT 4054 IN tel["Jennifer"]
>>> PUT 4098 IN tel["Timo"]
>>> PUT 4134 IN tel["Guido"]

>>> WRITE tel["Jennifer"]
4054
```

```
You can write all ABC values out. Tables are kept sorted on the keys:
>>> WRITE tel
{["Guido"]: 4134; ["Jennifer"]: 4054; ["Timo"]: 4098}

The keys function returns a list:
>>> WRITE keys tel
{"Guido"; "Jennifer"; "Timo"}

>>> FOR name IN keys tel:
WRITE name, ":", tel[name] /
Guido: 4134
Jennifer: 4054
Timo: 4098

You can define your own commands:

HOW TO DISPLAY t:
FOR name IN keys t:
WRITE name<<10, t[name] /

>>> DISPLAY tel
Guido 4134
Jennifer 4054
Timo 4098

To find the user of a given number, you can use a quantifier:
>>> IF SOME name IN keys tel HAS tel[name] = 4054:
WRITE name
Jennifer

Or create the inverse table:
>>> PUT {} IN subscriber
>>> FOR name IN keys tel:
PUT name IN subscriber[tel[name]]

>>> WRITE subscriber[4054]
Jennifer

>>> WRITE subscriber
{[4054]: "Jennifer"; [4098]: "Timo"; [4134]: "Guido"}

Commands and functions are polymorphic:
>>> DISPLAY subscriber
4054 Jennifer
4098 Timo
4134 Guido

Functions may return any type. Note that indentation is significant -
there are no BEGIN-END's or { }'s:

HOW TO RETURN inverse t:
PUT {} IN inv
FOR k IN keys t:
PUT k IN inv[t[k]]
RETURN inv
```

```
>>> WRITE inverse tel
{[4054]: "Jennifer"; [4098]: "Timo"; [4134]: "Guido"}

>>> DISPLAY inverse inverse tel
Guido 4134
Jennifer 4054
Timo 4098

A CROSS-REFERENCE INDEXER

'Text files' are represented as tables of numbers to strings:

>>> DISPLAY poem
1 I've never seen a purple cow
2 I hope I never see one
3 But I can tell you anyhow
4 I'd rather see than be one

The following function takes such a document, and returns the
cross-reference index of the document: a table from words to lists of
line-numbers:

HOW TO RETURN index doc:
PUT {} IN where
FOR line.no IN keys doc:
TREAT LINE
RETURN where
TREAT LINE:
FOR word IN split doc[line.no]:
IF word not.in keys where:
PUT {} IN where[word]
INSERT line.no IN where[word]

TREAT LINE here is a refinement, directly supporting
stepwise-refinement. 'split' is a function that splits a string into
its space-separated words:

>>> WRITE split "Hello world"
{[1]: "Hello"; [2]: "world"}

>>> DISPLAY index poem
But {3}
I {2; 2; 3}
I'd {4}
I've {1}
a {1}
anyhow {3}
be {4}
can {3}
cow {1}
hope {2}
never {1; 2}
one {2; 4}
purple {1}
```

rather {4}
see {2; 4}
seen {1}
tell {3}
than {4}
you {3}

MORE INFORMATION
Full details of ABC and the implementations, along with many example programs are in the book "The ABC Programmer's Handbook" by Leo Geurts, Lambert Meertens and Steven Pemberton, published by Prentice-Hall (ISBN 0-13-000027-2).

See also Steven Pemberton, "An Alternative Simple Language and Environment for PCs", IEEE Software, Vol. 4, No. 1, January 1987, pp. 56-64.

There is an irregular newsletter available from us (address below), and an electronic mailing list for discussions; to join send your preferred email address to abc-list-request@cwi.nl .

IMPLEMENTATIONS
There are currently versions for Unix, MS DOS, the Mac, and Atari ST. Various people are working on ports to other machines and systems.

The sources for the Unix version have been posted to the comp.sources.unix group on Usenet [not yet appeared though]; the binaries to comp.binaries.{mac, ibm.pc, atari.st}. They are also available from some servers (for instance by anonymous ftp from hp4nl.nluug.nl [-n 192.16.202.2] and mcsun.eu.net [-n 192.16.202.1]), in the directory {pub}/programming/languages/abc, or send the mail message
request: programming/languages/abc
topic: index
to info-server@hp4nl.nluug.nl, for a list of the available files, or use
topic: <filename>
to get one of the files. At the time of writing the files are:

INDEX
README
abc.intro
abc.mac.sit.hqx
abc.unix.tar.Z
abcpc.arc
abcst.arc
abcversions

All the implementations contain documentation. They are also available by post from us at nominal cost.

We will be posting a demo of two of the DC Utils v2.0 programs to the net very shortly (probably today).

More demos will be forthcoming (of the other programs in the package). In the archive we will send is complete info, but here is a brief rundown:

DC Utilities version 2.0 (new manual and disk): $20.00 (US)
Postage and handling $3.00 (US), $5.00 (abroad).

All the programs in the package have been upgraded, and you also get more programs on the disk than before.

Retail price has gone up to $39.95.

This upgrade constitutes a major upgrade. You'll see for yourself in the demo.

This post is in response to the WAACE AtariFest Questionaire.
1. I definitely thought the show was worthwhile. It's about the only place to find very much Atari related stuff these days.
2. Cost was not a problem.
3. I did not learn very much that was new to me except for some tidbits from developers about new products. The biggest disappointment(not your fault) was the lack of any new information from Atari. No indication of any plans on how they might revive interest in Atari computers in the U.S.
4. There were problems getting the overhead projection to work for some of the seminars I attended. This should have been worked out well ahead of time. Also some of the presenters had obviously not prepared anything in advance. I think you should make it clear that if someone agrees to make a presentation that they should have some idea of what they are going to discuss. Bob Brodie made a very polished presentation - unfortunatly the information content was nil.
5. The MIDI room provided the best presentations that I saw. They were obviously very well prepared.

> puts the DOS boot sector on the disk. DCFormat will do this for you.

I've only had experience with HP 3-1/2" disk drives in HP Vectras, so this
may not apply to all PC clones, but...

The Vectra can read ST-formatted disks just fine. You don't need to have the
DOS boot sector on the disk. In fact, when I've used FORMAT /S to format
disks on a Vectra, my ST can't read them. Nor do I need to use DCFormat on
the ST; the default formatter works fine (TOS 1.0 or 1.4).

Some people have had trouble reading ST disks on their Vectras, because they
forget to install the device driver that comes with the 3-1/2" drive. The
device driver allows the Vectra to read and write a multitude of
"near"-MSDOS-formatted disks without any problem.

(The device driver is only necessary for the newer HP 3-1/2" drives. The
old "classic" drives read/write to the ST disks without it.)

I've traded the Vectra for a workstation, so this information is only current
as of August 10 (last time I flopped disks on a Vectra). I mention it here
because of the possibility that other high-class clones (e.g. Compaq) may
have the same mileage.

Then again, the Vectra may be a truly unique machine ... :-)

[discussion on the Mac Classic at $1500 vs. ST, STe, Mega, etc.]

Well, I wouldn't want to bet on the success of an "ST Classic". Maybe
Atari would sell them as bundled systems for $299 at Wal-mart or Costco.

Most serious computer buyers will see the Mac Classic for what it is:
it's the rest of Atari's old inventory, packaged in new cases (maybe?)
and spruced up a little. They're just trying to clean out the warehouse.
(It's definitely not "back by popular demand", a` la Coke Classic. Most
Mac users would like to see all the old macs sent to sanitary landfill.
Compared with the current Mac, the originals were real bow-wows.)

PLEASE! No Mac-vs-ST wars! This is a marketing issue, not a technical
issue, and we all know about the success :-(of Atari's marketing dept.

One other note:

HP used to sell (not any more) an external HPIB 3-1/2" disk drive for MSDOS machines. This drive worked flawlessy, on *anybody's* near-DOS disk. The product has since been discontinued (I know, I know, but I don't work for marketing...) and the few remaining inside HP are guarded by shotguns and Dobermans. Everybody liked them.

If you have one, hang on to it forever.

In article <49.271466c4@vger.nsu.edu> manes@vger.nsu.edu writes:
>> I think it's a good deal because it kicks serious ass over similarly priced
>> and loaded PCs and Macs. And Ataris and Commodores.
>
>In what way does the NeXT machien that you are describing kick ass seriously
>out of the Atari and the Amiga? Or is this just hopeful speculation?

Software: bundled, pretty advanced, Mach, display PostScript.
Processors: '40 and the DSP
Screen: 17", only black and white, but you don't pay an extra $1000-$2000
Ethernet: good if you can use it... but it's included

In addition, the purchase price apparantly includes a license for all the
uncopied software as well. So if you need DTP, go buy the extra disk
space you will need, and get FrameMaker copied for you.

Granted, the other machines have more software, but unless you are a devotee
of some particular software packages, the NeXT for (what is it?) $3600
is a "best buy." In addition, this deal is aimed at the university market,
and I suspect that most computers sold are for two uses: running specific
programs like various Mac word processors or graphics, and for programming
and networking. If you are in the latter category and are not tied to some
particular software package not included in the bundle, then the NeXT looks
like a real deal.

Now to wait for the SPARCstation educational discounts :-)

BTW, since this is an atari group: why does atari have so many versions of
the same machine: the STes, the Megas, the Stacy. Note, there are many
macs as well: Plus, SE, SE/30, IIxx. but the capabilities of the different
machines are somewhat varied. The STs are all basically the same machines
with the same clock speed and processor; they differ only in memory.
Shouldn't Atari just make the Mega box and have SIMM sockets. OOPS forgot
about Stacy. They should keep Stacy.

> Be seeing you...
> -Bill Mills
>

Actually this way is easy compared to how I do it...just try to follow this:

First, I ftp from a site, say terminator, to my account. Takes very little time (ftp is FAST). Then I ftp from my account to one of the MacSE's here in the lab...all our macs are connected to the Internet via a K-box. From the mac SE, I put the file onto a disk.

I take the disk to one of our Mac II's, where I format a disk 720K MS-DOS style. Then using Appleshare I move the Mac format ST file to a MS-dos disk, which I can take home and put in my st.

This sounds like a lot, but it will take me less than 10 mins to get any size file up to 700K, where it would take me mucho longer to Kermit the file.

Now my only problem is how to get the 756K arc'ed file of TEX to my computer...

Point: Yes you will have no problem downloading atari stuff to the IBM...

2557. XLISP

Newsgroup: comp.sys.atari.st
Date: 1990-10-12 22:42:52 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <9045@helios.TAMU.EDU>
Source record: 237977

To my AI joy, there is a nice LISP interpretter called XLISP available for the Atari ST. The XLISP 1.6 interpretter does wonders, but it is not fully implemented. The stuff that is implemented is great and has not had any bugs that I could see. The XLISP version 2.0 is fully implemented, but things like trying to print a function. Xlisp 2.0 totally crashes when I use a fration or anything with floating point operations (which work under XLISP 1.6). When the XLISP 2.0 crashses I receive an error indicating that XLISP was not compiled with the flag for floating point.

I tried to recompiled it with my Laser C compiler, but I don't have all of the XLISP code for the megamax compiler. I get errors on a command called "overlay" which is not described in the LAser C manual. Also, all of the math functions are just plain missing for the Megamax compiler. It looks like other versions don't need the math functions, onkly the Megamax compiler.

Please, would someone re-compile the latest Xlisp and uuencode it and send it to me, or better yet, recompile it and then send it back to the archives in Michigan. Thanks.

>I've received several messages from MAIL-DAEMON at uunet that it can't send
>messages to terminator/atari.archive (host mailrus) - is everything working
>normally? I've used both

mailrus.cc.umich.edu has been down recently because of disk problems. There
is absolutely no reason that your mail from tamu to atari.archive.umich.edu
should be going through either mailrus or uunet unless you are using a bang
path to route it. in that case, the solution is simple -- don't do that.

if you forward the bounce message to postmaster@umich.edu they will be able
to give you the true, honest story.

obst: did you notice the discussion in the Amiga group about the Atari ST
emulator?

kawakami@earthquake.Berkeley.EDU (John Kawakami) writes:

- BTW, since this is an atari group: why does atari have so many
- versions of the same machine: the STes, the Megas, the Stacy. Note,
- there are many macs as well: Plus, SE, SE/30, IIxx. but the
- capabilities of the different machines are somewhat varied. The STs
- are all basically the same machines with the same clock speed and
- processor; they differ only in memory.

They use only one processor because TOS 1.0, 1.2, and 1.4 only works
with a 68000 (Although we know about those guys in Europe. But then
Atari Corp. is too stubborn.).

- Shouldn't Atari just make...

Interesting choice of words. :^) Atari should do a lot of things,
but they don't. Hopefully this will change after COMDEX. IT HAD
BETTER!

Atari should do a lot of other things for the ST, but they don't.
They like to dabble in other markets with the Portfolio, Lynx, and
those wonderful pocket calculators. We hope that Uncle Jack, in his
infinite wisdom :^), is right on this part. Atari Corp. is growing,
although few people can explain its stock price. We would also like
to see the ST do better in the US at least, but alas, we must wait
for Atari to make the moves.

- - the Mega box and have SIMM sockets. OOPS forgot about Stacy.
- They should keep Stacy.

The STe's and TT should be a good change from the conventional STs.
Although the STe is still considered a 'closed box,' you can upgrade
its memory easily and add a faster processor like a 68030 fairly
easily, from what I understand. Moreover, I played some Noisetracker
modules on my STe and they sound spectacular.

There doesn't seem to be a comp.windows.mgr newsgroup, so here we go...

Now that Bellcore's MGR windowing system has been ported to the Atari ST, I've been having a bit of fun playing with the system again. I've just taken the source for screen 2.0a and gutted it, rewriting it to support sessions in MGR windows. Sort of like the Unix-Windows programs for Mac and ST, but instead of running a unix-windows program locally, you just use a dumb-terminal program and MGR.

I guess it suddenly occurred to me that maybe this had been done before... Yes? No? Anyone interested?

[... Screen was written by Oliver Laumann at the Technical University of Berlin. I kept the code which dealt with setting up the sockets and pseudo-terminals, and detaching and re-attaching sessions. Threw away all the terminal support stuff, added support for MGR menus and such... It's pretty nice, when all you have between your desktop box and the rest of the world is a serial line...]

No, you need a disk driver for this. Even worse, though, is that the ST
hardware is not fast enough for the 1.44MB format. You have to replace
something in the ST disk controller mechanism for this to work, as well as
getting the disk driver. I've seen some company marketing a kit that will
let you do this.

> and spruced up a little. They're just trying to clean out the warehouse.

I think you're way off base.

Apple isn't cleaning out old inventory. They're setting up new production lines to crank out hundreds of thousands of low-cost, low-price Macintoshes in an effort to regain market share lost to PCs and clones. I don't know precisely what the new machines will have (the announcement is Monday) but advance reports suggest they'll have 16-megahertz CPUs. These are not marked-down Mac 512s with extra memory. They're Macs for the masses. They're Macs for Apple II owners. They're Macs for would-be Tandy/Blue Chip/Amstrad/PS-1 buyers.

John Sculley has spoken freely and at length about the strategy. Apple is taking lower profit margins in order to build market share and, in the long run, save the company from becoming an also-ran. In the short run, the Mac Classic strategy is going to hurt Apple's profits.

I personally would not be interested in one, but most first-time buyers would have a hard time passing up the new, cheap Mac to buy an ST.

>anyone intrested in knowing the site with this program it is abcfd20.larc.nasa.
>gov directory incoming/amiga program name atari1.
>
> John T.

I was invited/challenged to come over to a friends the other day to try out
some of my software on Atari1 on his Amiga 500. Here are the results:

Degas (original): -Can't flip between screens
-Have to reboot to exit
UniTerm 2.0e: -You can't flip back to term screen
-Doesn't talk to the modem
-Eventually bombs
Opus 2.23: -Works just fine! (REAL slow scrolling
-Actually printed out a graph!
Cool Tetris: -BOOM!!
Battle Zone: -BIG boom! (Had to turn off the Amiga)
Drachen: -Loads title screen, then wierd garbage
-Had to reset
Joust: -Atomic blast (Had to power cycle)
Star Raiders: -Ditto
Unix Windows: -Woudn't talk to the modem

I was truly amazed that it ran Opus at all considering that it uses GDOS.
It didn't load desk accessories at all. Everything was very slow, especially
the disk accesses. It took about two minutes to load the GDOS fonts. The
color resolutions were VERY flakey. Mono was better but the whole screen was
stretched vertically and was about 1.5" too low. It was very difficult to
read any fine, horizontal lines due to interlacing.

I can't possibly believe that this thing is legal. It would be quite a trick
to reverse-engineer all of TOS GEM and the ADI and have it work. It simply
looked like a hacked version of TOS 1.2 (1040 TOS). Many of the dialog boxes
for the desktop were just loaded with different text.

It would seem that the serial port and sound are not supported in any fashon.
The printer seems to work, though. Also, Atari1 takes over the whole
machine. You have to reboot to get out.

All in all, I don't think I'd call Atari1 an emulator - not even close to the
level of the Mac emulators. It's just an interesting/illegal hack job.

More novelty than utility. Oh well, at least Amiga users can run Opus now,
at half speed. (No, I didn't give him a copy)

BTW, George Harrison, are we going to see a new version of Opus soon?

There is a new product called PowerDrive by a Company in Utah that changes your floppy disk controller to a newer Western DIgital controller and allows one to hook up 5.25 (1.2meg) and 3.5inch (1.44meg) floppies to the Atari ST. Just review recently in ST INFORMER magazine ... the 1.44 drives are completely downward compatible with all software including copy protected software ... the only thing that was not working is SPECTRE-GCR in the MAC mode ... but Dave Small is working on that too ... so it may be only a matter of time.

Replacing your hard disk should not be too hard if you have a host adapter like Supra's (v2.0) or ICD 's. Formatting with Supra Software you really don't have to worry about since you just select the drive name and controller and format it ... ICD's should be similar. The article you wish about hard disks and floppy disks is called Hard Disk Warfare by David Small in Start magazine

It really depends what version of Laser C you have v2.01 is very clean versus v1.01 it also works very nicely under Beckmeyer's MT-C or C-Shell it even works with Mark Williams C's shell also Gulam ... the shell still has some conflict (the laser shell that is) and so I like to use the MT-C shell for much of my work.

If you want to use a really nice intergrated enviroment on the PC Turbo C++ has a wonderful shell with hypertext help which includes examples ... on all functions in Turbo C++ ... also all examples in the help system can be copied directly into the editor.

Hello everyone!!!

Since there has been so much talk about hacks to perform on the
ST, I decided to send a hack I found on a BBS sometime ago to
comp.binaries.atari.st. It is supposed to increase the color palette to
32,768 color and be compatible with the JRI 4096c board and the STE. I
don't know how it works and I have not tried it yet. If someone is
willing to do it please post the results of this hack.
Also, could someone please E-mail or repost instructions on
how to add a 1.44 meg 3 1/2" drive, and I think someone mentioned that
they added two slim-line drives in the place of his standard ST drive.
Would it possible to stick two 1.44 meg drives in the place of my 720k
in my Mega? Take care!

Sincerely,

Michael Rose

2582. The ST, the IBM, and Mac FDHD drives

Newsgroup: comp.sys.atari.st
Date: 1990-10-14 20:11:09 UTC
From: mg20+@andrew.cmu.edu
Message-ID: <ob6ANRy00VIAE0gXMZ@andrew.cmu.edu>
Source record: 237902

I write for the alternative newspaper here. When I do my article writing, I like to do it at home on my ST. I submit my articles on disk to the Mac-using editors because retyping s**ks, and the paper is desktop-published.

How do I do this, you ask?

Well, since the ST writes disks in (damn close to, but not exactly) IBM format, what I need is a Mac that can read IBM (MS-DOS) disks. The new Mac SE's and above have FDHD drives that can do this.

At first I couldn't get the Mac to read the Atari/IBM disk. I did everything: 720K format, 360K format, etc. It seems that the Atari writes disks just different enough from true IBM format to screw up the (very primitive) Apple File Conversion Utility.

The solution? Format the disk you save your data on on the FDHD-equipped Mac. The Apple File Conversion Utility lets you do this, just pop a blank disk in and it will ask you if and how to format it. Select MS-DOS format, at whatever density your ST can handle.

This disk will be accepted by the ST, although it will be a little different from standard ST format (ex. the Mac will *INSIST* you name the disk; this name will appear as a file on the ST desktop (leave it alone!))

I basically translate ASCII text, command codes really screw the conversion process up. I go from Word Writer ST (ASCII saves) to MacWrite format. Data such as spreadsheet stuff might be possible.

Anyone with any response/advice/similar situation can email me here at CMU.

>Chip/Amstrad/PS-1 buyers.

Apple is hurting because of MS Windows 3.0. For the first time, Apple is
seeking help from Japanese computer manufacturers... they are going to
license someone to make a new Mac portable for them.

I just finished reading the latest issue of MacWorld, which features
a preview of all three new Macs, and for Apple, the prices are _low_!
The Mac Classic is simply one model to replace the Mac Plus and SE... it's
an 8MHz 68000. The other two are the Mac IIlc (low-cost color) and IIsi.
The lc is a 16MHz 020 with built in 256 color video (16.7mil pallete), and
has and expected street price of about $2000 (!), the si is a 20MHz 030,
also with built in color video, and expected street price of about $3000.
Both new Mac IIs include a built in sound digitizer, and they will
probably replace the SE30 and the IIcx.

These now low cost Macs, along with the $1500 price reduction on the
IIci, are a bold move to regain market share by Apple. They will make good
competition for similarly equipped 386/486 PC's (though the new NeXT machines
might compete with them too, but those are more workstation-type computers).

What does all this mean for Atari (as well as the Amiga)? They will be
caught in the middle of a major price/performance war between Mac II's and
PC clones. I don't expect the ST/STe/Mega (or similar Amiga models) to
survive... Atari and Commodore had better concentrate on their 68030
computers, and Atari in particular should actually start _selling_ the TT
instead of just announcing that it's "coming out soon"...

I agree completely. If the strategy works, it will be VERY bad for
Atari and Commodore.

>
> Apple is hurting because of MS Windows 3.0. For the first time, Apple is
>seeking help from Japanese computer manufacturers... they are going to
>license someone to make a new Mac portable for them.

Windows 3.0 is nice (still a little kludgy, but I guess not any moreso
than TOS), and I DO think it is eating into Mac AND Atari and Amiga
sales. If Apple can take some of the price advantage (Macs already
have the utility adavantage) away from PC clones running windows,
perhaps the Mac will start to regain some of its market share that
has been lost to PC clones. The outcome can only be negative for
Atari. They are having trouble turning a profit at current margins.
Can you imagine what their earnings will look like if they have to
cut back on the margin to compete with Apple? I think I hear
violins playing...

Yep, I saw the article too. I was impressed. Macs aren't speed
demons by any stretch of the word, but they are one of the easiest
platforms to use and to teach relative beginners to use. At these

prices it just doesn't make sense to buy a non-standard ST. Now,
you can get a color 68020 Mac for the cost of a 68000 ST with
equivalent memory and HD space offered in the new Macs.

> These now low cost Macs, along with the $1500 price reduction on the

I wasn't aware of a $1.5K price reduction for the ci. That makes it
VERY attractive. YOu can buy a ci from stores in NYC for about
$3000 right now. At $1500-2000, it would be a steal! Who cares
if it pumps out 5% less drystones than an A3000 or TT (if they
ever go on sale that is)? The benefits to owning a Mac outweigh
that in my mind, particularly from an ease-of-use standpoint.

> What does all this mean for Atari (as well as the Amiga)? They will be
>caught in the middle of a major price/performance war between Mac II's and
>PC clones. I don't expect the ST/STe/Mega (or similar Amiga models) to

I don't think Atari or Commodore are in a position to fight in any
kind of pricing war with Apple. They don't have the resources.
Atari is practically on Food Stamps as it is. Commodore is a little
better off than Atari, but also suffering from a cash-poor
situation.

>survive... Atari and Commodore had better concentrate on their 68030
>computers, and Atari in particular should actually start _selling_ the TT
>instead of just announcing that it's "coming out soon"...

Well, as is often the case in the high-tech business, the early-bird
gets the worm. Atari is VERY late this time and may end up starving
before the next worm pops his head above the soil.

2586. Z-modem programs for the ST?

Newsgroup: comp.sys.atari.st
Date: 1990-10-15 04:25:12 UTC
From: rcb@netcom.UUCP
Message-ID: <14793@netcom.UUCP>
Source record: 237906

I have downloaded the 'grzsz14' file from atari.archive and wonder if that is really the latest version of Z-modem there is for the ST. The reason I suspect that there are later versions around is that the 'sz' program doesn't seem to implement sliding windows, but the 'rz' program does. Also, I happen to know that the latest version of Omen Technologies' rz/sz programs is at least at 3.0 and the grzsz14 programs say they are 'based on rz/sz v. 1.23 01-15-87 Unix V7/BSD, by Chuck Forsberg'. Are there any grzsz-type programs out based on a later version of Omen's rz/sz? Does Ome Technologies make any Z-modem programs for the ST? Finally, has anyone out there gotten any of the Unix versions to work under Mint?

Thanks ...

Roy Bixler

> John T.

Of course the key word is "seems". The emulator may also contain a
work-alike of TOS, a la 64 emulator that recently came out for the
Amiga.

OR

****
I don't see how the refresh rate can be slow on a 16 or 25 MHz 68030 CPU. Sure, the CPU takes on a big burden, but it's a fast CPU. The 8 MHz Amiga does great color animation and game-play - I would think a 16 or 25 MHz 68030 color Mac
would at least be its equal, don't you? --a MacIIseries owner on c.s.mac.games

2588. Re: New Apple Mac rumoured...

Newsgroup: comp.sys.atari.st
Date: 1990-10-15 06:48:40 UTC
From: umochock@ccu.umanitoba.ca
Message-ID: <1990Oct15.064840.5143@ccu.umanitoba.ca>
Source record: 237908

All this talk about low-cost Macs is encouraging. If I was
forced to pick one computer as my favourite, I would
choose the Mac. I use a Mac all the time at work.
However, I still wouldn't buy one.

The trouble with the Mac is that ALL the periphials
cost an arm & a leg. This is where the ST has an
advantage. Also, the fact that Apple likes to go its own way
when it comes to hardware interfaces rather than using
industry standards (e.g. centronics interface) is annoying.

What I look for in a home computer is not power or speed, but
flexibility. IMHO, the ST is much less dependant upon its
native OS than the Mac is. I get the impression that the Mac
will always be dominated by the Mac OS. I don't see TOS on
the ST as being as dominant. That's why I say the ST is
more flexible than the Mac.

Source record: 237910
Cross-posted to: comp.sys.atari.st,comp.sys.amiga.games

In Battle Command, you take control of a tank in any
of the available 16 missions. You can choose any mission
from the start, but in some missions you will need equipment
earned in other missions. The graphics look truely excellent,
and the screen update is fast. Some missions are brainless
shoot-'em-ups, while other require a lot of strategic thought.

This game will certaily be worth buying(from what I've seen),
and should be released very soon now.

The only negative point I can find is that you have to take
part in MISSIONS, and not going for a full blown war, like
Carrier Command. This is only a small gripe, though.

Carrier Commander Per Chr. Oedegaard (perod@ifi.uio.no)

I use "UUE" or ("uuencode" with "split") to split up a big program.
The ST is fine for putting things back together. With Gulam, I can use cat,
for instance. Or, I can name the files appropriately, and UUD to put
things back together.

2593. Mint for TC

ST Pen Pals list
TIPS AND HINTS from other users

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, and STacy.
There are also emulators for the Apple Macintosh and IBM XT available.
Finally, there is the Lynx (a game machine) and the Atari TT and ATW.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st
comp.sys.atari.st.tech
comp.sources.atari.st

What sort of articles would interest people reading comp.sys.atari.st?
======================================================================

The most interesting articles are technical articles, impressions of
software/hardware, information on Atari user-groups and shows, or helpful
hints on how to make better use of the machine and its software.

The least interesting articles are in the form of 'my computer is better
than...', especially when cross-posted outside of comp.sys.atari.st. If
```

you don't know how to eliminate other newsgroups from a reply to an article which is cross-posted, ask your systems administrator.

'FOR-SALE' articles should be posted to misc.forsale, and ONLY local distribution of comp.sys.atari.st. Those outside the United States have little desire to read about that neat bit of [hard/soft]ware you're selling when you live in the U.S.A. If you don't know how to restrict distribution of a posting, ask your systems administrator.

Many articles are in the form of "How do I...?" or "Where do I...?" In this article, I will try to answer some of the most-often asked questions.

Where can I get Public Domain/Shareware software?
==========
Thanks go out to Russ Evans, Rainer Klute, and Edgar Roeder for the European information.

There is are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

For anonymous FTP: atari.archive.umich.edu [141.211.164.8]

User anonymous
<enter password>
cd /atari

The atari.archive server is now available via e-mail as well. To find out more about bart (the mail server), send a message to atari@atari.archive.umich.edu with a body of "help". You will get a message back with the help file.

For anonymous FTP: dsrgsun.ces.cwru.edu [129.22.16.2]

NOTE: I have been unable to obtain directory information using anonymous FTP to dsrgsun.ces.cwru.edu [129.22.16.2] ... I assume that the archives which used to be on this machine are unavailable until further notice. If anyone has more information on the status of dsrgsun, please contact me.

For anonymous FTP in the UK: uk.ac.lancs.pdsoft

User pdsoft
Password pdsoft

This is a national public domain archive, available to sites in the UK only via JANET. Mail access is available from within the UK - send mail to archive-server@lancs.pdsoft for information.

For anonymous FTP in Europe: unido.informatik.uni-dortmund.de
[129.217.64.60]

Some selected Atari ST software is in the directory pub/comp/atari-st

There is also the info-server, a mail server which (among other things) mirrors the panarthea archives. Unfortunately it is not up to date and presently contains only volumes 1-10. You can get more info about the server by sending any mail to info-server@unido.informatik.uni-dortmund.de. It will reply with usage instructions.

For anonymous FTP in Europe: cs.uni-sb.de [134.96.7.254]

Contains the most interesting tools of the german PD-scene, most of the GNU programs ported to the ST (including ports of emacs and bash and an extended version of bammis library for gcc) and also ports of software posted to comp.sources.unix, alt.sources and comp.sources.misc.

For the panarthea mail server, see Steven Grimm's monthly posting.
Panarthea holds all of the comp.sources.atari.st/comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so.

How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc.ttp - needed to extract the other archivers, once.
arc_602.arc - latest version of ARC, with the most fancy features
and quite a lot of documentation
lharc.arc
zoo_bin.arc

There are also several GEM programs which act as 'shells' for the archive programs. The most popular are Shareware offerings, also available on atari.archive server in the /atari/archivers directory. They are:

arcgsh21.arc - European in origin
arcsh197.arc - US in origin

The GEM shells are recommended for inexperienced users (and appear to be quite handy for the experienced user as well!) They require a copy of the archive program -- in other words you need BOTH the GEM shell *AND* the archive program in order to use the GEM shell.

NOTE: arcgsh has been updated to version 3.1. It is currently unavailable on the atari.archive server, but should be available on the panarthea mail server.

Documentation on the use of the archive programs should accompany the archive files mentioned above. To use ARC.TTP in order to extract these files, use the command line:

xh xxxx.ARC *.*

where 'xxxx' is replaced by 'arc_602', 'zoo_bin', etc. For example

xh arc_602.arc *.*

will place all files within the arc_602.arc into the current directory. It assumes you've clicked on the ARC.TTP program from the Desktop and have the parameter dialogue box on your screen.

In many cases, simply typing a '?' or 'h' will provide an extensive list of available options.

Source and binary code for archive programs have also been posted to comp.sources.atari.st and comp.binaries.atari.st. They are available via e-mail through the panarthea archive server. See Steven Grimm's posting for more information on how to obtain files from panarthea.

What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

Below is a letter, originally written by Darryl May,
that John Townsend of Atari posted on GEnie in January to provide some answers. This letter also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170).

Dear ATARI customer,

The following is an official list of the errors that can appear while you are operating your ST computer. This first list gives you the GEM error messages:

What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of
STart, volume 1 number 1 said...)

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and
more)" by Douglas N. Wheeler from the atari.archive server. The file is
/atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The
file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files
or font files (at least those supplied by Atari). You can get these files with
many commercial programs, such as Degas Elite, WordUp!, etc. You might also
want to check your local user group to see if they received a copy of the
WordFlair demo program (also available on GEnie). The demo program appears to
have the GDOS system and font files.

Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex, or the dsrgsun server under
pub/atari/StTeX (not accessible as of this date). Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

Public Domain/Shareware languages...
==========

Check the atari.archive server under /atari/languages. Currently included:

abc recently posted to comp.binaries.atari.st
apl demo version
forth Don't know which one. I recommend Bradley FORTH

xprolog
xscheme

*Version 1 of GNUSmalltalk is also available on dsrgsun.ces.cwru.edu. It
*requires a minimum of 4 megabytes of memory. It is also in the pub/atari
*directory.

NOTE: The dsrgsun FTP service does not respond to directory commands as of the
date at the top of this article, so there is no way of knowing whether
GNUSmalltalk is available there at present or not.

Is GNU C available on the Atari ST?
==========

You can also get the GNU C program, which runs on 1 megabyte Atari ST systems.
For more than minor programming, you may need to upgrade to 2 or more
megabytes, as the GNU programs generally assume you've got plenty memory.

*GNU C for TOS is available via anonymous FTP on dsrgsun.ces.cwru.edu
*[129.22.16.2] in the pub/atari directory. Be sure to check the README file
*before going further.

NOTE: GNU C for TOS is available via anonymous FTP on atari.archive. The
dsrgsun FTP service does not respond to directory commands as of the
date at the top of this article, so there is no way of knowing whether
GNU C is available there at present or not.

Where can I get copies of ZNET?
==========

ZNET on-line magazine is available on CompuServe and GEnie. You can also get
copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg
Lindahl provides an excellent service to the networking community by sending
these out.

ZNET and some information from the Current Notes user magazine are also
available from the atari.archive server under /atari/magazines.

ST Pen Pals list
==========

Simon Chappell is compiling a list of people interested in exchanging
paper-based mail "of interested parties who could then
keep in touch and prevent themselves losing touch with the ST community
at large (this would be especially easy if someone who still had net
access could summarise current topics or forward news and advice!)"

He is accepting entries in this format:

eg Simon Chappell.
s61304@uk.ac.psw.pa (NOTE: NO LONGER VALID ADDRESS...)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

Contact Simon at his paper mail address if you are interested.

TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

==========

I would like to thank those who sent messages with suggestions and comments. I would appreciate feedback, comments, suggestions for more TIPS AND HINTS, etc. E-mail can reach me at the following:

>let you do this.

DreamPark Development in Utah ((801) 943-4370) sells both 1.44 meg boards and boards with drives if you don't already have a high density drive. Installation by a qualified technician is recommended unless you are a competant hardware hacker since installation involves cutting out the WD1772 controller chip, soldering a socet in it's place, and running several drive select lines from the sound chip to the new disk controller board. Install an autofolder driver and away you go.

Mine has worked flawlessly since I installed it several months ago. Very nice since because of the 2x data transfer rate of the high density drive, not only do your floppies hold twices as much data, but the read and write twice as fast.

I am not in any way connected with DreamPark Development.

2597. TCP/IP for the ST, recent code

Newsgroup: comp.sys.atari.st
Date: 1990-10-15 16:26:44 UTC
From: glenne@hpnmdla.HP.COM
Message-ID: <810023@hpnmdla.HP.COM>
Source record: 237917

Source and object code for Rob Jansen's modification of the KA9Q
TCP/IP package for the Atari ST has recently been posted on hpcol.hp.com.
This code allows Telnet,FTP,Finger,SMTP etc to be run using the ST.
Both the standard serial port and MIDI drivers are provided.
The package is particularly adapted for amateur radio networking but
can be used on wire lines as well to network multiple STs or STs and
a variety of other computers including IBM, Amiga, and UN*X machines.
Look under pub/ka9q/pe1chl for the files which are compressed using
lharc. A short file listing the other's contents is also provided.

I am not offering to provide these files by mail to those not having
anonymous FTP access. However, someone else may be.

Source record: 237918

Hi everybody.

I have the following problem:
on my unix account, i have some pictures in ".gif" format.
(no, not only from alt.sex.pictures). I can copy then to disk and take them
home, but i cannot display them, so what i need is an utility to view
gif pictures.

Has anybody ported "showgif" or some similar utility to to ST yet ?

If so, would you please send me a copy of the .prg and/or source ?

Thanks in advance,
The Lateman

I have copies of both of the emulators, I plan to send them to Atari and see what the legal dept. thinks. Anyone interested can get them at the following site:

abcfd20.larc.nasa.gov
look in the directory /incoming/amiga
give the command 'dir Atari*' and you will see the 4 files for it.

>workstation only gobbles up disk space up to several megabytes.

Hi. I created that upgrade set. I've gotten mail from several people who
have applied it successfully. Did you ftp in binary mode? Did you cat all
the pieces together before trying to uncompress it? Those are the only
reasons I can think of for it to have failed to uncompress...

From: rrd@hpfcso.HP.COM
Message-ID: <7340007@hpfcso.HP.COM>
Source record: 237923

> I have the opportunity to buy a Magic Sac with the ROMs at what
> seems to be a good price. ($20) Could anyone please tell me how good or
> bad this device is at emulating a Mac???

Check first to see if they're the 128K ROMs. If they are, then it's worth
the price just for the RAMs. You can use Magic Sac "as is", but to really
make yourself happy, buy a new Spectre GCR to go with the ROMs.

Magic Sac was an early (the original?) Mac emulator for the ST. Spectre GCR
is its most recent reincarnation. Sac required you to transfer everything
from the Mac disks to non-Mac disks in a roundabout way, while Spectre lets
you read/write the Mac disks directly.

Worth the money.

I have seen this info posted before, but sorry, I forgot what
was said.
\
With DRAM prices now down to $5.00 for 1MegX1 120ns chips,
I feel that I could afford the $80.00 to upgrade my stock 1040ST to
2.5 meg using the "socketed 2.5 Meg upgrade" text file that was posted
to the net last year.

Is 120ns a safe speed, or should I go with 100ns??

Anyone have any experience with the upgrade that I mentioned? It was
the one where you swapped 256K chips (16) for 1Meg ones.

2605. gcc questions

Newsgroup: comp.sys.atari.st
Date: 1990-10-15 21:51:50 UTC
From: waal@cwi.nl
Message-ID: <2362@charon.cwi.nl>
Source record: 237925

I would like to know if the GNU C compiler (version 1.37 I think) can be used on a 1040 with 1Meg memory. I downloaded all the binaries, include and lib files, but 'gcc' does not seem to do anything (the prompt comes back after a few seconds, but apparently nothing has happened). Trying all the compiler passes by hand, I can get 'cpp' to work, but cc1 gives two bombs. Any comments?

I have had trouble getting MiNT to work on my 1040. I want to run Gulam from it, but I have not been able to get past the boot stage. I have TOS 1.0, so I cannot do the autobooting trick mentioned in the docs. Someone who has MiNT up and Running on their system please tell me how they did it, what programs go where, etc...

also, if there is a better shell than Gulam that is better suited to run under MiNT I would appreciate that information also.

Thanks, respond by either a post or by e-mail.

oh jeezus.... So now the Atari users, who are enjoying the use of PC-Ditto
and software Macintosh emulators are getting ready to prevent other people
from doing the same thing on other computers??? I don't believe this.

Haven't we learned anything from the GNU/Macintosh debates? The entire
reason GNU has stuff out for Atari and NOT for Mac is because Apple is so
sue-happy that GNU felt it a waste of time to port it onto a computer which
is run by such a haughty company (this is just my interpretation of it - I
am sure that if someone stated only the facts over this debate, which took
place quite a few years ago, other interpretations can be made).

And why would it hurt Atari if Amiga users were running Atari programs on
it? All that would do is increase the popularity of the ST - more people
would be using it, and perhaps buying software for it, and maybe even
WRITING software for it!!! This sort of behaviour should be encouraged,
don't you think?

I think Atari should be flattered that Amiga users are going through SO
MUCH TROUBLE to run the awesome programs available on their (our) wonderful
machine!!!

MiNT works fine from an AUTO folder. Try the following:
(1) copy mint.prg to the AUTO folder of a boot disk
(2) copy init.prg and gem.prg to the root folder of the same disk
(3) reboot
(4) at the "%" prompt, you can type "gem" to start the desktop up under MiNT,
or type "exit" to leave MiNT and start the desktop under TOS

If you always want to start the desktop under MiNT, do the following:
(1) rename "init.prg" to "shell.prg" (or whatever). Someday you might want
this shell. If you're sure you won't, you can just delete it.
(2) rename "gem.prg" to "init.prg". Now when you boot up, after the MiNT
startup information the desktop will be run automatically.

In either case, you'll have to run gulam by hand, just as you normally would
under TOS 1.0.

I don't know what good something like this will do. 1)The original
author of the emulator is unknown. Hence there is no one to take
legal actionn again. 2) The thing has been spread to the ends of
the Amiga community. (Almost every BBS I know of have it, and
this has been since 4-5 months ago.) There is also another version
which doesn't contain the TOS, it tells you to go out and find
the TOS on a bootable disk and put it in the drive. 3) It might
ruin a perfectly good Ftp site. Alot of net priveleges are disappearing.
Like alt.* groups and ftp sites being censored because of small
incidents like these. 3) The thing doesn't work on most amiga's.
4) It doesnt work well in color, and only seems to run about 50%
of ST software in Mono.

At most, some ftp sites will be forced to delete it, but its already in
mass circulation, and most bbs sysops won't even realize its illegal.
And out of the ones that do, they probably won't do anything about it.
I don't support piracy, but this is the cold hard facts. I have seen
AMAX spread around on BBSs and the majority of people thought it was
freeware. (Amax=Mac emulator)

2612. New Mac prices

Newsgroup: comp.sys.atari.st
Date: 1990-10-16 06:53:22 UTC
From: tinyguy@quiche.cs.mcgill.ca
Message-ID: <5281@quiche.cs.mcgill.ca>
Source record: 237932

For those people who's curious about the actual price of those new Macs,
here it is :

Seen in InfoWorld:

Mac Classic Mac LC Mac IIsi
proc: 68000@7.8336MHz 68020@16MHz 68030@20MHz, PMMU

video: mono, 9-inch 8-bit onboard 8-bit onboard

sound: output only in & out in & out

ram: 2Mb to 4Mb 2Mb to 10Mb 1Mb to 17Mb

expansion: none 020 Direct 030 Direct or
Nubus (adapter must
be purchased)

storage: optional 40Mb 40Mb 40Mb or 80Mb

availability: Now Jan, 91 Now

price: for 2Mb/no drive: 2Mb/40Mb drv: 2Mb/40Mb drive:
$999 $2499 $3769
for 2Mb/40Mb drive:
$1499

Note that the LC and IIsi need a monitor:

Monochrome (12"): $299
RGB (12"): $599
High-res RGB (12"?): $999

so a complete LC goes from: $2798 to $3498
and a complete IIsi goes from: $4068 to $4768

Also, the LC comes equipped with an Apple IIe emulator and it can run almost
all apps for the IIe.

Note that all prices are list. No educational pricing was mentioned in the
article.

> macs as well: Plus, SE, SE/30, IIxx. but the capabilities of the different
> machines are somewhat varied. The STs are all basically the same machines
> with the same clock speed and processor; they differ only in memory.
> Shouldn't Atari just make the Mega box and have SIMM sockets. OOPS forgot
> about Stacy. They should keep Stacy.
> John Kawakami kawakami@ocf.berkeley.edu

Good point. To make matters worse, here in the UK many dealers are
still also selling STFM bundles too. I guess the reason Atari doesn't
just make the Mega box is that they're more expensive. It's going to
get worse rather than better: to judge from Derek Mui's messages of a
while ago, the Mega STE's a strong possibility, with SIMMs and the new
TT desktop.

At the moment, in the UK at least, an STE with expanded memory is pretty
good value - half the price of an equivalent Mega. The main thing
present buyers have to worry about is whether the machine bought is old
stock (with an early version of TOS 1.6 and/or a faulty DMA chip which
screws up most hard disks) or new. As Atari aren't *officially*
admitting that there were ever any STEs with faulty DMA chips, it's hard
to tell without invalidating your warranty and finding someone who knows
how to tell the difference without messing around with a hard disk. (Or
am I wrong here? Does anyone know a reliable, non-invasive test
procedure?)

From article <2669@dali>, by icsu8053@ming.cs.montana.edu (Craig Pratt):
>
> All in all, I don't think I'd call Atari1 an emulator - not even close to the
> level of the Mac emulators. It's just an interesting/illegal hack job.
> More novelty than utility. Oh well, at least Amiga users can run Opus now,
> at half speed. (No, I didn't give him a copy)

Thanks for the info on the Atari1 emulator, Craig. I think I might wait
a while before dumping my ST for an Amiga. :-)

>
> BTW, George Harrison, are we going to see a new version of Opus soon?
>

Doug Harrison actually, but don't worry, I make this sort of mistake
too.

The last time I was in contact with him, he'd put his plan to write a
completely new spreadsheet on hold. He wasn't sure there'd be a market
for it, and he was waiting to see how successful the TT would be. From
that, I guess we can take it that the new program will be either a long
time coming or won't arrive at all. As far as I know, Doug hasn't done
any more work on Opus since v2.2 (2.3 for shareware contributors).
Shame, as it's a fine program except for a few niggles (having to press
the f9/f10 keys to enter labels/formulae, etc.)

Doug didn't want to do more work on Opus because some of the changes he
wanted to make involved getting very deep into the code. He said that
since he'd learned about the vagaries of GEM through writing Opus, he'd
sooner start again and do the job properly.

Perhaps he could be persuaded to do something if enough people asked
him. He's been writing programs for CodeHead Software recently, so you
could reach him there or (I think) at the address in the Opus info box.
Also, he's on CompuServe: address your queries/requests to
72277.2315@compuserve.com

Information on the ST emulator for the Amiga can be found in the recent issue of computer Shopper (either Sep or Oct) in the Amiga section. There are two in existent. One is a software emulator that the author calls a real joke. The other is a hardware emulator call the Medusa which I think is still in development.

+ oh jeezus.... So now the Atari users, who are enjoying the use of PC-Ditto
+ and software Macintosh emulators are getting ready to prevent other people
+ from doing the same thing on other computers??? I don't believe this.

+ Haven't we learned anything from the GNU/Macintosh debates? The entire
+ reason GNU has stuff out for Atari and NOT for Mac is because Apple is so
+ sue-happy that GNU felt it a waste of time to port it onto a computer which
+ is run by such a haughty company (this is just my interpretation of it - I
+ am sure that if someone stated only the facts over this debate, which took
+ place quite a few years ago, other interpretations can be made).

Yeah, but PC-Ditto and Spectre are _legal_... If they (the creators of
the so-called ST emulator (which apparently is buggy as hell)) had
licensed TOS/GEM, fine--no complaints. But even _I_ have a problem with
something so blatantly (apparently) illegal.

2623. DeskJet stuff & Life!

Newsgroup: comp.sys.atari.st
Date: 1990-10-16 15:49:10 UTC
From: jeroen@pluto.phil.ruu.nl
Message-ID: <860@accucx.cc.ruu.nl>
Source record: 237943

I have just posted the FULL version of Life (with text and samples) to
c.s.a.st.binaries as well as some utilities for the deskjet and deskjet
plus printers.

I have also uploaded them to atari.archive, filenames are:
lifeuniv.arc (arc 6.02 needed - subdir!)
djstuff.arc

Included with this posting are excerpts from the accompanying text files.

Enjoy! Jeroen. (jeroen@phil.ruu.nl)
----------Cut Here----------

This file accompanies the two accessories DJ+_SET.ACC, DJ_SET.ACC and the
program DJDUMP.PRG.

Both accessories are configuration utilities for the HP DeskJet/HP DeskJet+
printers respectively.

The DJ+ has, in combination with the ST, an ugly feature: if it's powered
ON after the ST has booted, the ST will think the printer is not available.
(:- that is, unless you buffered the STROBE line)
Before you switch on the DJ+ the ST *DOES* think it can print.
If you call the DJ+_SET accessory it detects an unavailable printer,
and - if appropriate - it resets the concerning hardware ST registers.

This means you can now switch your DJ+ on after system powerup: just call
the accessory once, and the printer will be available.

Since I had to make an accessory for the DeskJet+ anyway, I thought I might
just as well add ome functionality in it too.

Once I finished that accessory it sprung to me such an accessory might come
in handy for ordinary DeskJet too: I stripped the code down a bit and
modified the resource.

Features:
- Release the printerport if incorrecty kept busy (DJ+ acc only);
- Set perforation skipping on;
- Set wrapping of long lines on;
- Set text scaling on;
- Choose between portrait and landscape printing (DJ+ acc only);
- Choose between 6 lines/inch and 8 lines/inch;
- Choose between letter and draft quality printing;
- Choose between 10, 16.67 and 20 cpi pitch;
- Select/disable left, right, top and bottom margins of one inch;
- Save your setup IN THE PROGRAM ITSELF (no extra setup file is used);

- No resource file needed (is included at compile-time);
- Configure the printer at boot time.

The program DJDUMP is a program to print screendumps on HP printers. It is a rewrite of a PD program I got from some ftp site; I have changed it in four ways.
First, the original program took about 2 kB of memory, mine needs only half.
Second, the original just dumped the screen to the printer: my version compacts the graphics data (it uses mode 2 graphics data), so most of the times the 32 kB of ST screen memory fit in the printer's buffer.
Third, my version also centers the screen dump, which the original did not.
The fourth change that I made is technical: making the program install itself legally. The original just stole the ST's system vector 'dump_vec' at $502, the old and illegal way. My version uses the XBRA protocol to install itself: the XBRA-id is "hpdj". It knows if it's already installed, so it will install itself twice. Other programs can find out if it's there too, by following the XBRA chain at $502.

Questions, bug reports etc.:

email to jeroen@phil.ruu.nl
----------Cut Here----------
Life v. 2.4

1. The Game of Life

Life is a 0-player game. It is played in a 2-dimensional universe, of which the opposing edges are connected.

The rules of Life are simple; at a certain location in the universe (called a cell) there is either life (the cell is alive) or not (the cell is dead). The only actions a cell can take is to die if it is alive and to be born if it's dead. These actions take place in cycli, socalled generations. Now the two rules of Life are these:
* Birth rule:
A cell that is dead in generation t will be alive in generation t+1 if and only if it has exactly three living neigbours in generation t.
* Death rule:
A cell that is alive in generation t will be dead in generation t+1 if and only if either it has less than 3 (exposure) or more than 4 neighbours (overcrowding) in generation t.
The death rule can negatively be stated as a survival rule:
* Survival rule:
A cell that is alive in generation t will be alive in generation t+1 if and only if either it has exactly 3 or 4 neighbours in generation t.

You may wonder what the interest of this game is. It just happens to be the case that Life has interesting mathematical/logical features: I will mention these briefly (without any proofs).
- Life's behaviour is chaotic; the question whether a given Life-

configuration will stabilise or not is not decidable. In short,
the reason for this is that Life can only determine certain
configurations - those that do stabilise in finite time.
- Life is powerful: it is a system as powerful as any computer,
since it can be shown to be equivalent to the One-Tape Turing
Machine, which in turn is equivalent in force to lambda-calculus,
RAM-based machines etc. etc.

2. Manual for ST Life 2.4

ST Life interacts with the user as usual, using the mouse, menus,
windows, dialogs, and alert boxes. Printing is performed by GDOS.

You can draw in the Life-window with the mouse: pressing the left
button somewhere will force the cell at that location to be born,
the right button will kill a cell.

Features:

Life is a full GEM-based application.

The option "Save..." allows you to save the universe currently
on screen to a file, for which you will have to choose a name
using the fileselector first. Note that Life uses the extended
fileselector if possible (TOS >= 1.4).

The "Print"-command prints the currently shown universe using
a GDOS printer driver.

"Random" initializes a universe randomly.

"Load..." loads a selected Life-universe.

"Random Factor" selects the probability of a cell to be alive if
a universe is initialized randomly, indicated by a percentage.

"Cell Size" selects the cell size to use: images of the sizes you
are allowed to choose from are selectable.

"Birth Rules" and "Survival Rules" allow you to change Life's rules.
You select the cases in which you want birth resp. survival to take
place.

2625. Old Western Electric modem

Newsgroup: comp.sys.atari.st
Date: 1990-10-16 16:11:54 UTC
From: rrd@hpfcso.HP.COM
Message-ID: <7340010@hpfcso.HP.COM>
Source record: 237945

Hello all,

I inherited an old modem and I'm trying to get it working with my ST. Can anybody out there help me with it?

The modem is an old Western Electric 1200-bps modem, connected to a touch-tone desk set. The label on the bottom of the modem says:

```
-------------------------------------
| |
| 470W2 DATA MOUNTING |
| P/O DATA SET 212AW OR ARW TYPE |
| SERIES 1 1V MG 78 |
| |
-------------------------------------
```

(I assume that the "1V MG 78" is a date code, and that the modem is about 12 years old...?)

There are 5 pushbutton toggle switches on the front:

AL ST RDL DL HS

There are 8 indicator lights on the front:

MB TR MR SD RD HS MC TM

The lights can be turned on in various combinations, depending on how you set the swtiches. Not all the lights come on at once.

I have tried several different switch combinations (less than 2^5 - 1) and haven't yet been able to connect to any local BBS's. Any help anyone could give me would be appreciated. I'll gladly pay for a photocopy of the original manual, even.

Please reply by email, as this is of limited interest to the rest of the net.

Many thanks
Ray Depew

2628. Looking for Joust

Newsgroup: comp.sys.atari.st
Date: 1990-10-16 17:58:18 UTC
From: cjy@uafhp.uark.edu
Message-ID: <5406@uafhp.uark.edu>
Source record: 237948

My son has reached the age where he shows some initial interest in my ST, specifically games, but I'll turn him around as he gets older. Anyway, I dusted off my ancient copy of Atari's "Joust" for him to play with, and, horrors, I can't read it on any of my drives! Losing this disk is pretty unforgivable on my part, as it is not even copy protected, but I guess over the years that it sat idle, I used my backup disks for more serious things. So, can anyone out there make arrangements with me to restore my disk? I'll provide whatever proof of ownership I can. (i.e. fax you a picture of it (next to a copy of today's paper, of course. :-)), or anything else you can think of.) Thanks in advance for any help.

2629. Quick ST II Challenge!

Newsgroup: comp.sys.atari.st
Date: 1990-10-16 18:03:16 UTC
From: darekm@microsoft.UUCP
Message-ID: <58268@microsoft.UUCP>
Source record: 237949

I'm not sure if a message I posted a few days ago made it anywhere because it was about 10K in size, so instead of reposting it, I will email it to anyone who is interested.

Anyone interested in finding out more about the Quick ST II Challenge should reply to this email and it will be emailed to you right away.

In a nutshell, the Quick ST II Challenge is this: we are so sure that you will like the new Quick ST 2.2, that we have released a FREE demo of it. The demo is already available for download on Compuserve and GEnie, and runs on the 68000, 68030, color, mono, Moniterm, etc, and is faster than even recent commercial releases of Quick ST or Turbo ST. (The real Quick ST 2.2 is even faster though). If you can't download the demo, we are offering to send you a disk containing the demo, ABSOLUTELY FREE. All we need is your mailing address. So reply to this email and I'll email you the complete details of the Quick ST II Challenge. And yes, you even get to keep the disk.

- Darek

2630. Emulation is GOOD! (was Re: We've been EMULATED.)

Newsgroup: comp.sys.atari.st
Date: 1990-10-16 18:27:30 UTC
From: gow@sakari.mrceg
Message-ID: <GOW.90Oct16132730@sakari.mrceg>
Source record: 237950
Cross-posted to: comp.sys.atari.st,comp.sys.amiga,comp.sys.mac.misc

I second the suggestion put forth in the referenced article. I would add that I don't really support pirating of OS software (except where there is no other way - get it Apple swine??) but, on the contrary, I think that it is in the interest of the smaller vendors (including Apple) to license their SW. Let's consider the numbers.

The most recent figures I've seen give Apple about 7% of the PC market. IBM and clones outsell Mac by 10 to 1. Because of this, the Mac has only recently got out from under the "But there's no software" cloud. With SW resources being shifted to Windows 3, they are probably headed back into that same bind. IBM has only an 11% share. The clones have most of the market. IBM, though, has been selling high priced PS2 systems to businesses and making money on it. They are guaranteed good software support by the volume of the clones.

Atari, Amiga, etc. have a tiny fraction of the market. They have been quite unsuccessful at attracting and keeping the interest of the big software houses. By facilitating emulation they quickly and cheaply increase their installed base. The hardware makers can still differentiate their products and compete. They will still have their current strong points - Atari's MIDI, Amiga's video, and such to go on. They also can generate revenue by selling OS software.

How can emulation help Apple? Look at their "new strategy". They spend resources developing and rolling out three new "low cost" products. The market reaction is not so good and their stock drops the day after the announcement. Will these new products give their installed base the boost it needs to compete with the IBM compatibles for SW development dollars? I doubt it. Furthermore, there are market segments that they have failed to address and it is costing them current, and therefor future, customers. The Walkabout by Outbound is a good example. It fills a market need that Apple has still not addressed. Why not get at least the SW dollars from that segment plus the future hardware sales to customers with lots of Mac software? Put simply, they are fighting Windows 3, not Atari, Commodore and Outbound - and they need all the help they can get.

Where would the IBM PC be without the clones? Probably in the trash heap with the PC Jr. (where I think it belongs) due to lack of market interest and software. Where will Atari, Amiga, and yes, Apple be without "clones"? Probably in the ditch with their broken-down software, watching the IBM world speeding past.

680X0s unite!! Crush the Intel dogs! Had they done it before the '386
then maybe they could have prevented the loss of the market to feeble
Intel chips.

2633. Atari ST emulator for the Amiga: Atari's position

Newsgroup: comp.sys.atari.st
Date: 1990-10-16 21:34:04 UTC
From: apratt@atari.UUCP
Message-ID: <2709@atari.UUCP>
Source record: 237853

Some people have expressed confusion over the legality of the "Atari emulator" now floating around the net for the Amiga. I understand that Atari's position is that it is a grave and flagrant violation of Atari's copyright, and we are asking everybody, especially archive sites and BBSes, to stop distributing it and remove all copies they have. I don't know why people think this *could* be legal: it's a derivative work from Atari's copyrighted material, and Atari intends to protect its copyrights.

Some people have expressed dismay that their favorite archive or BBS might get in trouble. In my *personal* opinion, the operators of these sites bring doom upon themselves by making uploads immediately available for downloading, with no checks on the content of the uploads. I believe that only a Common Carrier, such as the phone company or an airline, can legally be blind to the content of the information or goods they transport and distribute. Everybody else is responsible for exercising due diligence to ensure that no illegal activity is going on using their equipment or service. Since this program is prima facie a copyright violation, a duly diligent sysop would not have made it available for downloads.

Finally, some people have expressed the opinion that Atari should be a "good guy" and take no action concerning this. That's nonsense. If you don't vigorously protect your copyrights, you lose them. Ignoring this could mean relinquishing all rights to protect TOS from copying and modification.

This message represents my opinions and things I believe to be true, but it is not to be considered a legal opinion from Atari's legal department or anybody else but me.

The full documentation, source, and binaries for overscan are on
atari.archive.umich.edu in ~ftp/atari/utilities/overscan.arc.

Note that this stuff is a little over a year old now. The authors
have since created a commercial product called AutoSwitch Overscan,
which is supposed to automatically switch back to normal resolutions
when running incompatible software. I have asked for more info on
the product, but have not yet received any reply.

> Great thanks to Eric Smith for MiNT; It look's quite well after some
> minutes playing with it. But if I start mgr and try to open a
> window (initially there is none) I get the error message
> Can't get a pty
> What have I to do here ?

You're welcome.

How much memory do you have? With 1 megabyte of memory, by the time MiNT and MGR are loaded there is very little left. You'll have to remove all ramdisks, etc. to get enough memory to open a window; also I recommend using a fairly small shell (e.g. MiNT's init.prg). Make sure that the SHELL environment variable is set to the full path and name of your shell, with a command like "setenv SHELL c:\init.prg" (you can put this in the file init.rc if you're using MiNT's default init.prg).

If all else fails, push CTRL-ALT-F1 twice and try again. The screen will show a trace of what's happening as you try to open the window; from this you may be able to see what's wrong.

From: dwy47@unix.cis.pitt.edu
Message-ID: <49468@unix.cis.pitt.edu>
Source record: 237858

Hi, pardon me if my questions are dumb.

I got quartet.lzh from the archiver and unlzh all the pieces. But it seems like whenever I ran the program, there's a system error and the screen just flashes by and return to the desktop. Do I have to have some kind of hardware and system setup (like some version of TOS or a sound chip etc) in order to play that?

Secondly, how can I get a unix from ST, if such exists. Is it PD or do I have to obtain from a vendor? What is Gulem, which I have heard a couple times.

Thanks

I did this memory upgrade twice. Once on a 1040st and once on a 520stfm. The important thing is to figure out which lines are being rerouted because the are not pin compatible. The plans are good but not perfect. The new 1040st mothter-boards are very different tahn the layout of the motherboard he described. All iin all it was a lot of work 8 to 10 hours. the plans have a liitle flaw in them.\

If anyone has any questions email me at emerson@stat.berk.EDU..seeya.....

2640. overscan & SCSI drives (help!)

Newsgroup: comp.sys.atari.st
Date: 1990-10-17 10:00:30 UTC
From: bointon@kcl-cs.UUCP
Message-ID: <1609@xenon.kcl-cs.UUCP>
Source record: 237860

Briefly, thanks to the dozens of replies requesting overscan details.
I will post it as soon as possible- there will be a delay though due to the problem I am about to describe...

Does anyone out there use more than one ST hard drive with GE-soft host (SCSI) boards???
I have been trying for quite a while to get more than one drive up at once- things work for a while, then slowly all the directories fall apart...
I have 3 drives and 2 host boards (both GE-soft). The drives are a seagate ST157N, a quantum 40S (or something, it's very quick) and a syquest SQ555 removable drive. in any combination, the problem is the same, and the same symptoms occur whether the drives are chained on the SCSI side or on the DMA side. I have tried reformatting and repartitioning two drives at once (I'm only ever using 2 at any one time- I have 2 STs) and things work just fine- loads of space, backing up couldn't be easier (syquest!) etc...
however, after a few megs have been thrown around, everything falls apart.
(Before anyone says- I'm using folder700.prg...)

Can anyone shed any light on this?? I am confused!!

Thanks in advance...
(My copy of the overscan mods was not backed up..., but I can get it again!)

2642. Re: The ST, the IBM, and Mac FDHD drives

Newsgroup: comp.sys.atari.st
Date: 1990-10-17 10:13:20 UTC
From: decouty@irisa.fr
Message-ID: <1990Oct17.101320.25471@irisa.fr>
Source record: 237862

In article <ob6ANRy00VIAE0gXMZ@andrew.cmu.edu> mg20+@andrew.cmu.edu (Michael Paul Greelish) writes:
| I write for the alternative newspaper here. When I do my article
| writing, I like to do it at home on my ST. I submit my articles on disk
| to the Mac-using editors because retyping s**ks, and the paper is
| desktop-published.
|
| How do I do this, you ask?
|
| Well, since the ST writes disks in (damn close to, but not exactly) IBM
| format, what I need is a Mac that can read IBM (MS-DOS) disks. The new
| Mac SE's and above have FDHD drives that can do this.
|
| At first I couldn't get the Mac to read the Atari/IBM disk. I did
| everything: 720K format, 360K format, etc. It seems that the Atari
| writes disks just different enough from true IBM format to screw up the
| (very primitive) Apple File Conversion Utility.

You are right: Mac AFE does not read ANYTHING but a 200% IBM format!

|
| The solution? Format the disk you save your data on on the FDHD-equipped
| Mac. The Apple File Conversion Utility lets you do this, just pop a
| blank disk in and it will ask you if and how to format it. Select MS-DOS
| format, at whatever density your ST can handle.
|
| This disk will be accepted by the ST, although it will be a little
| different from standard ST format (ex. the Mac will *INSIST* you name
| the disk; this name will appear as a file on the ST desktop (leave it
| alone!))
|

Another solution is to use ibmfmt.tos from Moshe Branner: it works perfectly well with Mac AFE. Putting a MS-DOS boot sector with DCformat (3.0) is of no use because DCformat keeps the original size of FAT, which, on ST is 5 sectors and on IBM is 3 sectors! I think AFE tests this info.

| I basically translate ASCII text, command codes really screw the
| conversion process up. I go from Word Writer ST (ASCII saves) to
| MacWrite format. Data such as spreadsheet stuff might be possible.
|
| Anyone with any response/advice/similar situation can email me here at CMU.

2643. Arcgsh 3.2 submitted to comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1990-10-17 10:43:38 UTC
From: klute@heike.informatik.uni-dortmund.de
Message-ID: <2726@laura.UUCP>
Source record: 237863

I just submitted a new version of Arcgsh to comp.binaries.atari.st. It has an automatic startup feature now: Just doubleclick on an archive file (say FOO.ZOO), Arcgsh starts up and immediately shows the right archiver dialog box (here: the Zoo dialog box) with the name of the archive file already filled in. Drawback for old-TOS users: This feature works properly only under TOS 1.4.

2648. Emulation is GOOD! (was Re: We've been EMULATED.)

Newsgroup: comp.sys.atari.st
Date: 1990-10-17 14:36:53 UTC
From: gow@sakari.mrceg
Message-ID: <GOW.90Oct17093653@sakari.mrceg>
Source record: 237867
Cross-posted to: comp.sys.atari.st,comp.sys.mac.misc

I second the suggestion put forth in the referenced article. I would add that I don't really support pirating of OS software (except where there is no other way - get it Apple swine??) but, on the contrary, I think that it is in the interest of the smaller vendors (including Apple) to license their SW. Let's consider the numbers.

The most recent figures I've seen give Apple about 7% of the PC market. IBM and clones outsell Mac by 10 to 1. Because of this, the Mac has only recently got out from under the "But there's no software" cloud. With SW resources being shifted to Windows 3, they are probably headed back into that same bind. IBM has only an 11% share. The clones have most of the market. IBM, though, has been selling high priced PS2 systems to businesses and making money on it. They are guaranteed good software support by the volume of the clones.

Atari, Amiga, etc. have a tiny fraction of the market. They have been quite unsuccessful at attracting and keeping the interest of the big software houses. By facilitating emulation they quickly and cheaply increase their installed base. The hardware makers can still differentiate their products and compete. They will still have their current strong points - Atari's MIDI, Amiga's video, and such to go on. They also can generate revenue by selling OS software.

How can emulation help Apple? Look at their "new strategy". They spend resources developing and rolling out three new "low cost" products. The market reaction is not so good and their stock drops the day after the announcement. Will these new products give their installed base the boost it needs to compete with the IBM compatibles for SW development dollars? I doubt it. Furthermore, there are market segments that they have failed to address and it is costing them current, and therefor future, customers. The Walkabout by Outbound is a good example. It fills a market need that Apple has still not addressed. Why not get at least the SW dollars from that segment plus the future hardware sales to customers with lots of Mac software? Put simply, they are fighting Windows 3, not Atari, Commodore and Outbound - and they need all the help they can get.

Where would the IBM PC be without the clones? Probably in the trash heap with the PC Jr. (where I think it belongs) due to lack of market interest and software. Where will Atari, Amiga, and yes, Apple be without "clones"? Probably in the ditch with their broken-down software, watching the IBM world speeding past.

680X0s unite!! Crush the Intel dogs! Had they done it before the '386
then maybe they could have prevented the loss of the market to feeble
Intel chips.

Not to defend TOS, but the fact that inly ROMS can be used is a hardware
matter, not of TOS.
By the way if I could choose I would prefer TOS over MS-DOS for sure.

2652. Zmodem restart?

Newsgroup: comp.sys.atari.st
Date: 1990-10-17 19:30:00 UTC
From: andre@compulink.co.uk
Message-ID: <memo.12429@cix.uucp>
Source record: 237871

Does anyone have a version of the Zmodem receive module (RZ.TTP) which will accept a LOCAL -r parameter to restart an aborted or crashed download?

The one I'm using at the moment requires the host system to request a re-start, and our system won't do that - it requires the remote user to set the mode.

Any ideas? (I need it to run as an EXEC program from Flash, BTW, so don't point me at a complete comms package that supports this feature).

Thanks,

Andre

Yeah, what about taking all the old roms and making thoe chip
bugs/friends/animals out of them?
``Yo, Amigo, wanna buy a neat chip-creature? We named them TOS...''
But that's most likely illegal too and the chips probably have to be destroyed.

The atarimgr.zoo file is over 400K in size and the mail server only allows
200K of requests per user per day. I guess I'll have to go in and manually
split the files. (mgrdemos.zoo is over 600K.)

The server allows 400k of request per day. If you want to get anything larger than that you must request it by parts until you get the whole thing.

This is all in the help file...

>(Say, I have an idea for a new feature for BART.... Oh Jon.... }-)

All the needed features are there. The trick is getting people to RTFHF.

Jon

The worst part about this upgrade was sucking the solder out of the over 300
holes; don't use your lips or a straw: possible lead poisoning. :^) :^)

The capacitors are 0.22uF 50V Ceramic Axial types (C80-C111) [available
from Best Electronis as a kit of 16]
Three resistors (33 ohm 1/4w) must be added; near the front edge of the
board in the center.
DRAM (1Mx1). I'm running 70ns parts in the additional 2-Meg, but I think
you can go as slow as 120ns.

4-Megs is great! Big Ramdisks! "Out-of-memory" no more! :^)

Good luck,
Pierre

2660. Why it is not power without price anymore?

Newsgroup: comp.sys.atari.st
Date: 1990-10-17 23:50:20 UTC
From: jalkio@cc.helsinki.fi
Message-ID: <3375.271cee3c@cc.helsinki.fi>
Source record: 237879

When the Atari ST came in the mid 80's it was the best price/performance machine, I think. But now I have begun to think that it isn't it anymore. I just hope they could have kept it that way... Well, now it seems to be the NeXT. Currently Atari's are similarly priced to Amiga's and Macs (because of the new cheapish models). I wish Atari had some kind of educational discount, since otherways there is no way I would buy a TT over a NextStation (Think about getting a 68040 machine with 8MEG, DSP, good monitor, Unix, and 105HD for $3500).

I think something has to be done. (And I wish something will be done, since there is lots of nice software for the ST, too.)

2661. GEM bug? (was: Re: Tos 1.4 bug?)

Newsgroup: comp.sys.atari.st
Date: 1990-10-18 00:16:38 UTC
From: fortinp@bwdls56.bnr.ca
Message-ID: <1990Oct18.001638.28515@bnrgate.bnr.ca>
Source record: 237880

I'm running TOS1.4. Something really strange happened last night...

Here's the sequence:
- under NeoDesk 2.05 I had two file widows open
- ran msh.prg (MWC)
- exited
- moved mouse to "NEODESK" (accessory dropdown) before the two file windows were redrawn
- got the outline of the first window
- the dropdown appeared
- the 2nd window appeared
- the first window filled in, overwriting the dropdown with which it overlapped

Things happened so fast that I don't recall any more details, but the file window and dropdown were a little confused until I clicked the mouse (I think this is where it ended). I was unable to reproduce it at will, but if it happened once...?
Seems symptomatic of code which does not prevent interrupts (like mouse asking for a dropdown) during a critical few instructions (like between drawing the outline and filling it). Just a WAG (wild-assed guess), but....?

Ciao,
Pierre

[...stuff deleted...]

If the modem is that old (oops, deleted the part of 78 in the date code),
it's only good for parts if you're a hardware hacker. I've got a bunch of
old 1200 baud Novation modems which are not compatible with *anything* in
today's market. They used a half-duplex line protocol of sort if I recall
corectly.

Spend your money on a new modem instead of photocopies of an antique; you'll
be happier.

Source record: 237883

I recently got SPACEACE.LZH from terminator and un-lzhed it with no problem. It made a file named 'SPACEACE.MSA' (I think). What is this file and how can you run the demo?

---jb

PS - Sorry, I have no news about any new Apple products, or price lists thereof, even though I know that they have a TREMENDOUS impact on the ST community at large. My apologies.

2665. Keys displaced on Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1990-10-18 08:37:16 UTC
From: johnr@praxis.co.uk
Message-ID: <5450@newton.praxis.co.uk>
Source record: 237884

I have just bought a Spectre GCR to use on my Atari 1040STF. I am getting a problem I have occasionally seen on real Macs, ie the keys on the bottom two rows of the keyboard are shifted left one place. So if I type 'x' I get 'z' and 'c' gives me 'x'. The space bar also moves over.

[I may have the direction wrong. It may be right instead of left, in which case 'z' displays 'x' etc. I'm not near enough to my Atari to check. Still you get the idea].

Someone told me that on a real Mac you can cure this by unplugging the keyboard and plugging it back in again. An option not available to me!

Anyone know a solution? It may be important to know that it's a UK Atari.

2666. help on megamax, please.

Source record: 237885

From : Steve, Inmos, UK.

Date : 18 October 1990

Subj : Help with Megamax.

I am using the Megamax C compiler to write a program which will perform maths on long words. I am having trouble getting a long variable to hold the number #80000000 (ie the most negative number possible in four bytes).

It does not seem to matter whether the number in inputted in hex, decimal or binary and I have tried putting in the number #80000001 (which works fine) and then subtracting 1.

When I try to print the result I get the characters '(..*()-)' or similar. The program does not crash, but then it does not give the correct result either.

I dont really want to change to another C compiler so any help would be appreciated. (Like does your machine do the same).

Please would you Email any response (as well as post it) because our server is flakey.

Thanks,

Steve, Inmos, UK.

NOT necessary. BART allows you to retrieve files in pieces. I haven't used it for a while, but you just type the parts (aa,ab,etc.) after the file name. Figure out how many you can order without going over the limit, and order only those parts. That's how I managed to order the whole gcc 1.37 source from BART (it took over a week -- I really prefer FTP when available).

Source record: 237892

Why would you want a word processor for the ST to move in the opposite direction that all the 'real' word processores are going? I think you'll be upset when WP 6.0 comes out.

Okay, now that I have a handle on this thing it's time for MY silly questions! What is Minix? Where is a .doc that will explain this to me?

I use SuperCharger with my ST, I think it's great. Couldn't be easier to install. The best part is the company (at last phone call) is still in business!

Can anyone tell me more (or show me info) about the 16Mhz upgrades for the ST? I have a 1986 520 with 2.5Megs in it.

Try ST Writer Elite. It is a Freeware? program and it came out in STart not long ago...there might be more recent versions since then. I know the version I use is 6.3 (I think) I have heard of more recent versions that that, though.

This word processor is just like Atari Writer on the 8 bit computers. I tried using most all ST word processors, but I finally returned to this one.

What really got me about the others is that they all use some kind of special format. When printed to the screen, ala the desktop, the characters would be run together. I found out this is because the spaces in these programs weren't real spaces, but non printing characters holding the place of spaces. (argh!)

Also, I found out that most word processors put an EOLN at the end of each physical line on the screen. That might not sound bad, but when you do stuff on a laptop (with a 40 col. screen) and only put EOLN's at the end of a Paragraph (like most wp's do, the EOLN at the end of the screen line is "invisible" to you, you know, WYSIWYG!), then when the text is ported over it runs on forever on one line (you know, the wp is expecting EOLN's after every line.) Well, ST Writer does not do that, you can load Ascii files and it will be ready to print after you add a few formatting commands to set up the page.

Ok, I will get off my soapbox. Oh, ST writer has a gem mode, if you want it, but even in gem mode, the editor screen is NOT a gem window...

Um, you do know that there is an ST version of WordPerfect, don't you?
The ST version is actually numbered 4.1, but it's functionally closer
to msdos version 4.2 than 4.1, and can easily import files from the
msdos 4.2 version. Yes, it's a GEM application, but screen updates,
searches, etc. are every bit as fast or faster that the msdos version
running on an XT, since the initial port was actually a complete
rewrite in 68000 assembler. And all commands are accessible from the
keyboard, so you never have to reach for the mouse. (And of course, it
supports every printer that was ever made.)

BTW, WP Corp. was planning a new release of the ST version sometime
this year; does anyone know if it's out yet?

> Thanks in advance.
>
> -Steve
>
> SteveLa@csulb.edu

DId you try sending to Darek@microsoft.UUCP ? I had to send stuff to a user the other day with a UUCP address and it worked fine. But the mail bounced when I replied to a message THEY sent...My mailer would not follow the path. It seems (at least on my Unix server) that when mail come FROM a UUCP address, it is expanded, and I have to send it back to "user@somewhere.UUCP".

I don't know if this works for all mailers, but at least on the one I use I just send it to "user@somewhere.UUCP" and it works.

2676. The Man in the Machine - Article

Newsgroup: comp.sys.atari.st
Date: 1990-10-18 15:06:18 UTC
From: owen@euclid.enet.dec.com
Message-ID: <16470@shlump.nac.dec.com>

Cross-posted to: comp.sys.amiga,comp.sys.ibm.pc.misc,comp.sys.dec,comp.sys.atari.st,comp.sys.mac.misc

Taken without Permission from "Dec Professional". Written by John C. Dvorak.

THE MAN IN THE MACHINE

Marci Peoples Halio, assistant director of the writing program at the University of Delaware, has discovered a peculiar phenomenon. Freshman taking her writing course who use Macs produce worse compositions than those who use IBM PCs.

Based on experience and a computer-aided analysis, she claims that Mac users make more spelling and punctuation mistakes and write at an eighth-grade level. The PC users were at a college level.

If this isn't bad enough, the Mac students write on vapid subjects. They concentrate on issues such as dating and television. The IBMers write about teen pregnancy, war and stuff like that. My conclusion: The computer makes the man (or woman, as the case may be).

I thought it might be worthwhile to take the concept a step further and compare writing on a Mac, a PC clone, and Atari Mega, and Amiga 2000, a VT100 hooked to a VAX and an IBM 3270 hooked to a 3090.

Unable to do this scientifically, I took a different tack. I was hypnotized and make to believe that whatever computer I used was my favorite. I was encouraged to express my thoughts about the machine and use it to list five topics about which I'd like to write.

While the unscientific results don't completely confirm the unscientific conclusions of Halio, they show a definite pattern and indicated that "you are what you write on." Here are the results, computer by computer:

MACINTOSH

Thoughts:
This is a neat machine. I love the mouse and feel superior to the poor saps who use anything else.

Topics:
1. New ice cream flavors.
2. Bruce Willis: actor, singer or Renaissance man.
3. Do those cleaners/waxes advertised on TV really work?
4. Was Rob Lowe unfairly treated after those incriminating video tapes were released?
5. Where's Brazil, anyway?

PC CLONE

Thoughts:
This is a very functional machine. I like it and feel superior to the poor saps who use anything else.

Topics:
1. Phenomenology in an age of bleached blondes and the implications of such a culture and its effects on Eastern Europe.
2. Tissue culture fraud at laboratories
3. Mating habits of native tree frogs.
4. Use of the word 'indeed' in 18th century literature.
5. Is "form versus function" a dead issue in modern architectural theory?

ATARI MEGA

Thoughts:
This machine is a bargain, and I can even make it run Mac software! I feel superior to people who paid more than I did.

Topics:
1. Atari compared to Mac.
2. Mac software on the Atari.
3. What's wrong with the Mac?
4. Why the Atari is the best deal.
5. The decline of bowling in America

AMIGA 2000

Thoughts:
This machine is fabulous, but nobody wants to talk about it. It's a cover-up. I love this machine but feel sorry for myself.

Topics:
1. Why the Amiga is never discussed.
2. Fancy video techniques done easily on the Amiga
3. How Commodore is blowing Amiga's marketing.
4. How good is true stereo on the Amiga.
5. New uses for the Amiga.

VT100 hooked to a VAX

Thoughts:
This is a real computer. I like it and feel superior to the poor saps who use anything else.

Topics:
1. Button collecting
2. I wish I had invented C.
3. How to borrow money.
4. Is the sponge bath making a comeback?
5. Efficiency in rebooting a VAX.

IBM 3270 hooked to a 3090

Thoughts:
This is a real computer. I like it and feel superior to the poor saps who use anything else.

Topics:
1. VM is the best thing ever!

2. Is RPG-II a victim of bad press?
3. How to make a bureaucracy work.
4. The history of corporate dress codes and their importance.
5. Alternate realities.

When the exercise was over, I looked at the results, went home and
wrote this column - in longhand.

[Please don't take this article as the start of some sort of a Flame war. I
thought it was funny, and thought it might be funny to some of you. -SO]

^^^^^
Wonderful, :-))))), I've bought 1.2 ROMs und 1.4 ROMs -- how much
money do I have to spend in the future to get a good OS for my
computer?

Atari should release this OS as PD and I hope, that we get a good OS
by the hackers here in Germany during a the next year. ;-))))))))))

Sometimes I think, I should burn most off my OS-9 OS into my ROMs and
remove all the TOS-stuff.

The .MSA suffix is for a Magic Shadow Archive, an archiver that saves an
entire disk into a file. You need the MSA program and a blank floppy to get
the demo into a running state.

Bleep! Wrong answer! Have you ever dragged (drug? :-) a folder to the
trashcan that was not empty? I do it all of the time, and it work just
fine as long as there isn't a folder called ".xxx" in it.

To refresh people's memory, there's a bug with TOS1.4 that will not allow
you to drag a folder to the trashcan and delete the files if there is a
folder in the folder that starts with a "." (ie: .jnk)

> Jouni

Oh come off it! I have a catalog from J&R Music World in front of me.
Here are two prices it shows:
Atari 520ST-FM
68000 processor
512KB RAM
Built-in 3.5 inch disk drive
$329.95

Atari 1040STE
68000 processor
1MB RAM
Built-in 3.5 inch disk drive
Blitter
Digital stereo
$599.95

When you can buy a mac for $600, you let me know. Take a look at the
520ST-FM price. A 68000 based computer, with a 720KB disk drive for
$330??!!? Jesus, what do you guys want, a miracle?

From: pbh@pandora.cs.wayne.edu
Message-ID: <1990Oct19.034959.10519@cs.wayne.edu>
Source record: 237809

I picked up a copy of MT-C shell at the WAACE show, and I have decided
to finally make the switch from Mark Williams C to an ansi compiler
(GNU). I modified the GNU.G file and put the SETENV and ALIAS's
into \etc\profile on my drive d:. However, I enter gcc hello.c
or cc hello.c the drive light flickers, the RD and SD lights on
my modem flicker, then I get the prompt back. Nothing's created!
I've looked thru the MT-C shell manual and I'm about to loose my mind!
Anybody using GNU-C with the Beckemeyer shell? Could you mail me
your profile? Including environment info below:

Atari 1040 ST (yes, I know GNU wants more RAM, the 2.5 meg ST is on it's
way from CA)
30 meg seagate
MT-C shell version 1.0
GNU-C 1.37 (or whaterver the latest from Terminator is as of last week)

Thanks in advance

> I want to send a mail message to "Darek@microsoft.UUCP". What should I type in the "To:" prompt?
>Thanks in advance.

In another reply someone mentioned that sending "user@host.uucp" always works fine for him. What works and what doesn't depends on your site's mail configuration. That usually depends on the competence and conscientiousness of your site admin. For the more brain-dead systems that are on the Internet, you can almost always get mail thru to a UUCP site by sending it to uunet. So for example, rewrite "darek@microsoft.uucp" as
darek%microsoft.uucp@uunet.uu.net
that will take care of 98% of the cases.

The other poster also mentioned not being able to directly reply to mail that originated from a UUCP site. You can usually take paths of the form
host-c!host-b!host-a!user
and again send 'em thru uunet:
user%host-a%host-b%host-c.uucp@uunet.uu.net

Sorry for the non-ST related posting, but it seemed worth mentioning. (Ok, take off the net admin hat, put the ST hacker hat back on. Much better... }-)

Source record: 237812
Cross-posted to: comp.sys.amiga,comp.sys.ibm.pc.misc,comp.sys.dec,comp.sys.atari.st,comp.sys.mac.misc

A lot of folks have been paying a lot of attention to Halio's article, even though the observations she makes were not made in a scientifically controlled setting. (Of course, it's really hard to even try to set up a good experiment for this. Get volunteers - where do you look? what media do you use to present the experiment? For an experiment that wants to make a broad statement about a general population, getting volunteers, and selecting which to employ, is probably 80% of the experiment. Statistically speaking, how many people from how many different working/living environments do you need to "test" to get a good representation of the population at large?)

Even assuming you can somehow select the ideal mix of volunteers, what can you prove - that Mac users are poor writers, or that poor writers like to use Macs? It's all such hazy stuff.... And yet, people are spending real money to do research on just these questions. I admit to being curious about what the real answer may be, but I don't think it's the sort of question that can be answered to anyone's satisfaction....

2693. TT and HD drives

Newsgroup: comp.sys.atari.st
Date: 1990-10-19 08:06:18 UTC
From: csbrod@medusa.informatik.uni-erlangen.de
Message-ID: <3178@medusa.informatik.uni-erlangen.de>
Source record: 237813

Hi there.

People keep telling me strange things about the TT: They drop in
1.44 MB drives, and ho, they are working properly without any
hardware mod whatsoever. TOS reads and writes HD disks without
a hassle; the DESKTOP formatter won't format them, but then,
there are third-party formatters that will. Can someone imagine
why they still sell the TT with those old drives? Dealers over
here tell me that it can't be a price reason for HD drives are
now as cheap as standard 720 KB drives. So: Why?

Source record: 237815

From : Steve, Inmos, UK.

Date : 19 October 1990

Subj : re:Help with Megamax.

In reply to my own message, which was :-

>I am using the Megamax C compiler to write a program
>which will perform maths on long words. I am having
>trouble getting a long variable to hold the number
>#80000000 (ie the most negative number possible in four
>bytes).

>It does not seem to matter whether the number in inputted
>in hex, decimal or binary and I have tried putting in the
>number #80000001 (which works fine) and then subtracting 1.

>When I try to print the result I get the characters
>'(..*()-)' or similar. The program does not crash, but then
>it does not give the correct result either.

Further investigation has revealed that the printf routine
appears to be the cause of the trouble. The routine will
print the hex version of #80000000 correctly but fails
to print the long decimal version.

ie printf("%lx\n",0x80000000L) gives 80000000
but printf("%ld\n",0x80000000L) gives -(..*)---) (or something!)

Maths on the number appears to work. I dont need to print the
number out in decimal so -my- problem has now gone away.

Thanks to Gary at Inmos for the help,

Steve, Inmos, UK.

> Atari 520ST-FM
> 68000 processor
> 512KB RAM
> Built-in 3.5 inch disk drive
> $329.95
>
> Atari 1040STE
> 68000 processor
> 1MB RAM
> Built-in 3.5 inch disk drive
> Blitter
> Digital stereo
> $599.95

Those are good prices for what you get, but I (and a lot of other people)
would like to see something much bigger and faster -- i.e., in the realm
of contemporary computers and not stuck in 1985. My ST has a bad memory
chip, and rather than fix, it, I eventually am going to replace it with
something faster. I'm not going to spend $3000 to do so.

For those who are interested in prices, here are some I picked up today
from my local Atari dealer. You can see how much prices have dropped for
memory-stuffed CPUs.

520STFM $379 1040STE
with 1MB $549 with 1MB $649
with 2MB $859
with 4MB $874 with 4MB $1019

|finally you got bgif(the nicest IMHO, converts .gif to standard 320x200
|16 colours Degas Format and shows it while converting)

Bgif also converts to Spectrum pictures. The result is usually inferior
color-wise to the Gif-Spectrum conversions done by Gifspec, which is
also PD. Unfortunately, Gifspec only runs in low rez and often does not
scale as large as Bgif. A third converter is the commercial product
Digispec. It produces the highest-quality results, offers the ability
to adjust color, lightness, and contrast, and generates the smallest
files. Unfortunately, it also often chops off edges on unusual-sized
gifs, and seriously distorts very un-square ones.

2699. What will "overscan" give me?

Newsgroup: comp.sys.atari.st
Date: 1990-10-19 12:02:09 UTC
From: jlong@radc.af.mil
Message-ID: <jlong.656337729@cassiopeia>
Source record: 237819

I am curious about the "overscan" modification.

I just upgraded to TOS1.4 (my gosh, why did I ever put it off for so long??)
and now that I __could__ perform the upgrade, I was wondering if I would
actually realize any day-to-day benefits.

I have a 1040STF,TOS14,Mono-monitor: Does overscan only work for color
systems? I read the docs and they mentioned a monochrome mode, but not
very detailed. Will I see a larger screen on my monitor?? Will the
black, wasted areas be utilized? Will it work with NeoDesk 2.05 (or
NeoDesk 3.0 providing Gribniff EVER sends it to me!!), what about Flash1.6
or Uniterm?? Will my Showdvi previewer use a larger screen?
Will this guy ever quit asking question? Are you still reading this??

Sorry, got carried away for a moment... But seriously, if anyone could give
us a brief, "real-world" view of what overscan (and overscan_60) will do
and post to the net (I think this is of interest net wide) I would really
appreciate it!!

From: jlong@radc.af.mil
Message-ID: <jlong.656338209@cassiopeia>
Source record: 237820

I remember reading a post about a month ago describing a new port of
TeX 3.0 to the ST that was done with Turbo C or with Lattice C (I don't
remember which) and was supposed to be the best thing since sliced bread
for those of us who use LaTeX!!

Is someone in a position to make this available to the U.S. FTP users?
I REALLY would like to get my hands on this!! As I remember the original
post/announcement mentioned several disks worth of stuff. I know there are
quite a few ST users of LaTeX here in the States (and Canada) that are probably
watering at the mouth to get this new, faster (Oh please, let it be faster!!)
version.

2701. Sozobon C and ANSI

Newsgroup: comp.sys.atari.st
Date: 1990-10-19 13:03:21 UTC
From: hans@wldrdg.UUCP
Message-ID: <419@wldrdg.UUCP>
Source record: 237821

Someone asked whether Sozobon C would ever appear in an ANSI version.
To put it simply, probably not (unless someone else does it).

Personally, I find most ANSI features annoying or simply useless.
I am currently working on a port of UNIX 5.4. It has a new compiler that
lets you select ANSI or K&R (compatability mode). The first thing
we invariably do is turn off ANSI. Otherwise you get a ton of useless
warnings.

If and when lots of public domain sources start being posted which
are in ANSI only (not optionally ANSI, optionally K&R), I MAY make
a version of Sozobon which is "ANSI accepting". This will take valid
ANSI code but will not necessarily produce all of the ANSI error
messages and warnings required by the standard. (It will not
include the full ANSI preprocessor with its totally bizarre recursion
limiting rules however). Thus 'const' and 'volatile' will be accepted
but totally ignored. Function prototypes will be taken but will NOT
be compared with each other to see if every last arg matches exactly.

As, I said, this will only happen when ANSI really becomes required for
lots of free sources. Until then I intend to use the K&R syntax. You
can too.

i have (finally) decided to start using gcc on the ST and am putting
Alcyon aside. too many #ifdef ALCYON's in my code, i guess...

however, i would like to know just how good GEM/line A support is with
that compilation system. i know the libraries (gemfast, et al.) exist,
but i don't remember seeing mention of their relative quality compared
to (say) Alcyon's bindings. can someone drop me a line with some
general recommendations regarding GEM programming (AES, VDI) with gcc?
do GEM applications port easily to gcc? obviously unix-oriented shell
applications do...

what is making me switch? MiNT (thanx, eric) and MGR and another 60 MB
HD for my mega4 :-)...

Ah, but will they do anything? Will it be in time?

>> Jouni

>Oh come off it! I have a catalog from J&R Music World in front of me.

My my, aren't we testy? You neglect to mention that these prices do not include a monitor. Besides, Jouni was speaking about POWER without the prices. Five year old technology in a repackaged box is NOT power.

>Here are two prices it shows:

Oh boy! Actual numbers to play with.

> Atari 520ST-FM
> 68000 processor
> 512KB RAM
> Built-in 3.5 inch disk drive
> $329.95

So what? Add in $200 for mono or $300 for color and you finally have a usable system (for about $600). Why don't you explain to me what "powerful" things you can do with a 512K 520ST these days with a 720K drive and no hard disk? If you spend an extra $100 for the color monitor, you can play games with it. If you don't spend the $100, you can do a little word processing (if you have small documents), but then you lose most of the games.

> Atari 1040STE
> 68000 processor
> 1MB RAM
> Built-in 3.5 inch disk drive
> Blitter
> Digital stereo
> $599.95

Big deal. You get the same as above with a little more memory and a Blitter chip to speed up screen re-draws. Still no monitor. With a monitor, you get $800 for mono and $900 for color. (Hey, that's funny. I paid about the same for my 1040ST in 1986. I'm sure the components are FAR cheaper than they were back then so why is the price unchanged?)

>When you can buy a mac for $600, you let me know. Take a look at the

Ahem, you CAN buy a Mac Classic with a 1.2 meg disk drive, 1 meg RAM
with its own little monitor for $749 (Computer Era in NYC). You get
a ready to use system (keyboard included too) for this with a friendlier
OS and more software support.

>520ST-FM price. A 68000 based computer, with a 720KB disk drive for
>$330??!!? Jesus, what do you guys want, a miracle?

Yeah, but when you add in the cost of the monitor, the price isn't much
lower than a Mac Classic. A $100 savings wouldn't make me want to buy
a relatively unsupported computer.

When you find a file with an .MSA extender, that referes to the Magic Shadow Archiver. I have run into the situation, too, of un-.LZHing a file and finding an .MSA within. Magic Shadow Archivers are available at most ST BBS systems of any size, at least in Vancouver, BC, Canada, it is on nearly all the free boards, and is Public Domain. If you are really stuck, and don't mind calling long distance, it is on my BBS at (604)531-1245.

2706. De-archiving

Newsgroup: comp.sys.atari.st
Date: 1990-10-19 15:49:17 UTC
From: manuel@fornax.UUCP
Message-ID: <1420@fornax.UUCP>
Source record: 237826

Can anyone out there in netland offer me any advice on this problem? I've been trying for three weeks to figure out how to de-archive downloaded programs and if it weren't for bad luck, I'd have no luck at all.
I am working from a Sparc1 and emailed panarthea for a list of de-archiving programs for the Atari 1040ST. Since the problems are always the same, I'll deal with my tribulations with uud/uue.
This program arrived by email, and the header informed me that it was uuencoded with the UNIX version of uuencode, so I UNIX uudecoded it. This gave me the file "dumasuux.arc" which I then transferred to a formatted floppy using MTOOLS. To be sure that I was not experiencing format-type problems, I transferred to both a dos(MTOOLS) disc and one formatted on my Atari. Then I took the discs home and added the de-archiving programme arcx.ttp which was on a STart magazine disc. I've used the program to de-arc other programs on the same disc, so I'm sure that it works. All that happens with dumasuux.arc is a white screen with cursor for about fifteen seconds while the floppy drive makes serious working noises, then pops back to the desktop. This happens with booz, zoo201g, pkunarc, shar,and unlzh14. I've also tried it with uniterm with no more encouraging results.
I've been tearing my hair out now for three weeks and am down to the last few tufts, which my wife wants me to keep. Any suggestions?
Oh, yes, I forgot to mention: when I tried to de-arc booz I got booz.docwhich had about one readable page, then became a garbled shambles, which just about describes me at this point.
All suggestion, either by email or post-to-net will be gratefully received.
Frank.

2707. Atari, TOS, and better yet

Newsgroup: comp.sys.atari.st
Date: 1990-10-19 18:31:10 UTC
From: ericco@ssl.berkeley.edu
Message-ID: <ERICCO.90Oct19113110@soc1.ssl.berkeley.edu>
Source record: 237827

It interesting to me that the Amiga TOS emulator should arrive on the net at the same time as Eric Smith's MiNT.

I think that Atari is entirely within their rights in preventing the distribution of TOS to the public. (One might even suggest that they are a social responible company for preventing its spread ;^). On the other hand, Eric Smith says that he is interested in having MiNT become a replacement for TOS, not just an extension. Assuming that MiNT progresses in this direction in a completely legal manner (like the IBM PC OS emulators), then what will Atari do? Surely, MiNT will be distributed on disk (not in ROM). Then the Amiga people will be able to emulate MiNT legally -- which will be better than TOS IMHO.

I hope I haven't put any words into Eric Smith's mouth. The point is, which operating systems have the most support from the computing community -- a closely guarded OS, or a public OS? Developers who work on Mac are relatively isolated from the rest of the world. They have specialize knowledge about the Mac which will never be useful on other machines. Conversely, Un*x and IBM PC programmers have a huge community. In fact, many applications programmers can write code that lives in both worlds (mainly because PC C compilers make up the difference between Un*x and DOS).

Public OS like OS-9 and Minix also have bigger communities because the same OS is available on several machines. Just think how nice it would be for *developers* if there was a TOS emulator for DOS machines (or TOS to DOS cross compiling environment, or some such). People like David Beckmeyer would be big winners, as their products would reach much larger markets.

But the fact is the Atari sells hardware not software. They don't want an Amiga TOS emulator, because they don't want a consumer to think "hey, I'll buy Amiga hardware and a TOS emulator for it, and get the best of both computer's software." Sometimes I think Atari sees software as a necessary evil.

>------------------------------+--------------------------

My dear pathetic Mr. Mauritz. You obviously cannot read English. My original 10K message containing the Quick ST II Challenge was never sent. I thought I did, but I guess I didn't. Instead, I posted a much shorter message saying that anyone who wants to find out more can reply to the message. That way I save a lot of bandwidth by not posting it here. I also am not emailing out copies of the demo because it is about 150K in size and that too would waste a lot of bandwidth. So even though in the last few days I have received dozens of email requests to email the demo, I am instead offering to send a disk, AT MY EXPENSE, to anyone who wants it. I have posted the exact same offer on Compuserve and GEnie. So I have "wasted" less bandwidth than you, who decided to repost my entire my entire message, plus your pathetic little mindless comments. Just because this is a free network does not mean we are limited to discussing only public domain software. What I posted was an announcement, similar to the announcements you will find from other commercial software vendors on bulletin boards, or bundled in an issue of ST Report or ZNET. You obviously cannot be reasoned with since your signature directs me to send flames to /dev/null, so if you have some problems with this go to hell. I know it is a new concept for you to grasp: someone giving away free demos on a disk without charging for it and no strings attached. Considering how many people responded to my posting, and how many of them used words like "ok, I'll bite" it proves my original statement that most people on the net are to cheap to consider buying commercial software, and it is only by offering it to them on a silver plate that they respond. I accept that as a fact of

life in the Atari world, and offering a free demo is my way of satisfying both me and the users. I could weasel out and start crying that the ST software market is dead and hopeless, but it is not. Quick ST II is one of the best selling pieces of software for the Atari ST, ever. That is why I can afford to sell it for $20 and still make a healty profit. So please stop trying to kill the commercial software market. Please? If you have anything further to say, please do so in private email and stop wasting bandwidth.

- Darek

Yet to be mentioned is the .GIF file viewer/converter present in DigiSpec
from Trio Engineering. Although DigiSpec's main purpose is to make Spectrum
pictures with Color Computer Eyes, it also works very well with .GIF files
(In fact, that's all I use it for). DigiSpec won't let you squash the picture
like you can with bgif, but it does automatically scale it to fit the screen.
It also lets you adjust the color balance, brightness and contrast. The
pictures it produces are of very good quality and it even works with pictures
the size of lush.gif. Outputs to spectrum format only (SPU or SPC).

I am new to the Net, and as an Atari games user, I am somewhat surprised that there is no newsgroup for Atari games, such as there is for Amiga users. Having completed both DungeonMaster and its sequel, I was interested in seeing what other Atari users thought of the game, or if there were folks who needed hints and such. Isn't there anyone out there who plays DM on the Atari??? If so, why aren't there any postings on the topic? Maybe it's time to start?

>Will this guy ever quit asking question? Are you still reading this??

Overscan works for both color and monochrome. On an Atari SM124 monochrome
monitor you will get 688x480 pixels, without any adjustments to the monitor.
(The author has since announced that he has tweaked it to display 720. Dunno
how.)So yes, the black wasted areas get utilized.

Neodesk 2.05 works fine with Overscan. Uniterm does not. I have a patched
version of Uniterm 2.0d that does. (It was too much effort for me to consider
doing it again for 2.0e...) I don't use Flash, so I don't know about that.
I haven't installed the font files on my system, so have never tried any of
the DVI previews. Dunno.

MGR works...

The standard version of overscan puts the video system into 50 hz (PAL) mode.
If you're particularly sensitive to video flicker, you'll notice the change.
I think it's the only way to make it worthwhile though - you have 340 (?)
scan lines at 50 hz, and you can tweak the video display to 280 scan lines.
At 60hz, there are only 262 scan lines, and you can only get 224 video lines
total. (This is for color, btw. Monochrome is as I described above.)

I noticed that the hardware limit for monochrome seems to be around 500 lines,
so getting 480 is probably about the most you'll see. I haven't seen anyone
get near 800 horizontal though.
>

2713. Atari Wordprocessors Continued

Newsgroup: comp.sys.atari.st
Date: 1990-10-19 21:56:47 UTC
From: jahromib@gpu.utcs.utoronto.ca
Message-ID: <1990Oct19.215647.5331@gpu.utcs.utoronto.ca>
Source record: 237833

I would like to thank the many people that replied on this topic (and also sent me email). I would like to reiterate a few points though:

1) Some of my fellow st'ers did not take well to my lack of appreciation for gem. My response is that gem is SLOW. text scrolling is laborious (and please don't tell me to run quick st or turbo st. Also, I mentioned _wordprocessing_ *not* DTP. When I wish to do simple dtp, I haul out my calamus and do a quick page. For real, complicated dtp (trust me, I have worked at a professional typesetting company) I rent time and use quark express on a mac ci, lino it and have the printers print 1000 or so newsletters. BUT, this is *not* wordprocessing. For wordPROCESSING, you do NOT want to be bothered by column placement, pixel shifts, microspacing, kerning, leading, etc. You wish to type, ie PROCESS words QUICKLY, and a window interface is a nuisance. Believe me, hitting some fkey to insert a code is far easier than fiddling with the ruler (and faster). And for those who may think that wind/icon/mou/pointer interfaces (the brave new world and rebirth of man/comp relationships) has made text and cli's (the diehard ignoramuses who refuse to catch up to the times) extinct, may I remind you that any operating system worth its salt has a shell.

2) many have kindly suggested a variety of ST progams (st writer elite, wordup, wordflair, etc.) Unfortunately, NONE come even close to the formatting dictionary, thesaurus, sort, merge, record, page layout (all in text!) footnote/endnote/bibiography, macro programmability, most important of all printer support (customizable!) of wordperfect (4.2 on). I am sorry to repeat the name "wordperfect", but I consider it a standard with its *combination* (note emphasis) of features that NO wordprocessor has approached.

3) other alternatives were suggested (Tex/Latex, nroff, etc.) I am honestly inclined to vi my stuff and then run it thru troff before I touch something windows based, and these suggestions are quite reasonable. The only excuse I have is that I prefer wordperfect's codes much better than typing in ".commands" and find its slight degree of onscreen formatting/character emphasis helpful.

4)WP 4.1 for the ST is buggy, clunky, and unreliable (this is the OFFICIAL release version by wp corp. fully updated). Using it is a misery, considering what it could have been. 4.2 does NOT exist (to my knowledge), neither is WP likely to release it (or higher versions, for that matter).

Finally, this is only my opinion. Obviously, many (quite rightly) will prefer the windowed interface and their favourite wordprocessor and I do not aim to batter down someone's opinion. Its just that the lack of choice and power on my st bugs me in this instance.
thanx for your time,
Babak

2714. Quattro Pro vs. Lotus

Newsgroup: comp.sys.atari.st
Date: 1990-10-19 22:07:20 UTC
From: mjducey@rodan.acs.syr.edu

Source record: 237834

I see that Lotus is kickin butt in the courts over its product. Or atlest my friend is always telling me so. I'm a fan of Quattro Pro. Does anyone know of a news group where I can keep up with the latest on this topic?

2715. Re: Atari Wordprocessors Continued

Newsgroup: comp.sys.atari.st
Date: 1990-10-20 01:56:33 UTC
From: ekrimen@csuchico.edu
Message-ID: <1990Oct20.015633.13937@ecst.csuchico.edu>
Source record: 237835

- 1) Some of my fellow st'ers did not take well to my lack of
- appreciation for gem.

Which is fine. I can respect other people's preferences (I think :^).

- My response is that gem is SLOW. text scrolling is laborious (and
- please don't tell me to run quick st or turbo st.

Why not? What's wrong with either of them? They offer a dramatic improvement even on an STe. I've said this before, and I'll say it again, that coming home to my STe is heaven after working on a Mac IIfx. The text drawing with TurboST or QuickST is great. Have you even seen them?

- You wish to type, ie PROCESS words QUICKLY, and a window interface
- is a nuisance.

Geez, you can't please everybody, can you? Most people (I know this is an irrational generalization) would think that they are a luxury. I think of a couple of text editors, like Emacs, ProText, and others, which I'm sure you've heard of, that offer text edited features, but no word processing functions. Guess you're stuck.

- Believe me, hitting some fkey to insert a code is far easier than
- fiddling with the ruler (and faster). And for those who may think
- that wind/icon/mou/pointer interfaces (the brave new world and
- rebirth of man/comp relationships) has made text and cli's (the
- diehard ignoramuses who refuse to catch up to the times) extinct,
- may I remind you that any operating system worth its salt has a
- shell.

I'm a wind/icon/mou/pointer, specifically GEM, kind of person. This is why I didn't buy an IBM in 1988. But each to his own.

- 4)WP 4.1 for the ST is buggy, clunky, and unreliable (this is the
- OFFICIAL release version by wp corp. fully updated). Using it is a
- misery, considering what it could have been. 4.2 does NOT exist (to
- my knowledge), neither is WP likely to release it (or higher
- versions, for that matter).

I'm sorry you can't find what you're looking for. I was almost sure that WP for the ST would have fit your bill, but alas, I was wrong. Moreover, you seem to be the programming type. Why not write one and sell it? :^) I'm sure there are few other ST users like you.

- Its just that the lack of choice and power on my st bugs me in this
- instance.

Unfortunately. On a machine who's default mode is a GUI, it would be pretty hard to imagine anything but a GUI for a word processor. I think that one reason most people (another irrational generalization, I know) bought the ST was for its easy-of-use. Luckily, for those power users who like a shell, those are available for the ST.

I called Wuztek Wednesday (say that 10 times fast :^) to ask about their monitors which show both resolutions. The Rainbow monitor which shows color and mono screens sells for $599 and the Greyscales monitor which displays all three resolutions, but in greyscales, sells for $349. Wuztek also makes other products, including an adapter to connect a PC-compatible keyboard to your ST, a monitor switcher like Monitor Master, and a product to connect your ST to a composite monitor like VideoKey. Here's their address if you want more information:

Wuztek

The archive on ummts.cc.umich.edu is pretty out of date. We (folks at atari.archive) started there originally, but the base system is sort of a pain to use. We just haven't cleaned off of there completely, and there is still a local user base that likes that system (MTS) more than Unix. (Or something like that...) Anyway..... Just about everything that's ever been on the MTS archives is also at atari.archive.umich.edu.

At some point it would be nice to go thru and cull out all the old stuff, but who ever has spare time these days, eh?

[And I haven't even gone thru all the circa-1986 stuff I grabbed when I was starting in this area. Yeehah. Funny how most people complain that there's not enough software, but every time I look there's too much to manage. Twisted world, eh?]

> on [WP] [...hitting an fkey is much faster and nicer than playing with the
> rulers...]

I think it's just a matter of preference. I never really like the WordPerfect (IBM or even mac version). I do most of my wp work at school or at work and I always use MSWord. I am a mouse/pointer/icon/menu kind of person. It's just bothering to use WordPerfect when I have to format the text here and there (usually out of order) and I have to juggle with fkeys (ctrl, shift, alt) and space bars, tabs, arrow keys....I would do much faster and better with a mouse, then the sequence ^f7,1,2,4,6 (as an example only, not a real sequence) (and I have to remember or use a template or cheat sheet).

But of course there are a lot of diehard IBM (even IBM is going windows and menu systems and all sorts...you give me a reason) users who still prefer fkeys applications. To them it's easy to use and powerful. To them, a mouse is like a mouse, real hard to catch.

2721. QUICK_DB problems

From: archbold@bluemoon.uucp
Message-ID: <4DNcR1w163w@bluemoon.UUCP>
Source record: 237841

Hi! I just ftp'd QUICK_DB from atari.archive, extracted it on my beloved 1040ST running TOS 1.0 and attempted to run the program. As it turns out the program displays title screen and says that there was error opening MAGAZINE.KEY (which didn't come in the *.ARC file) and aborts.

What is that file? Is it some sort of keyword (or number) that the program compares to it's own and decides whether it's valid? If the program is PD (as it should be since I got it off of atari.archive) why is there sucha thing installed?

Does anybody know what the problem might be? How about the author?

> already (1st word, wordwriter, and others that don't even know what the concept
> of a tab is and have the worst printer support possible, even 1st word..)
> What wouldn't I do for a st version of wp (please, with NO windows, NO gem,
> just nice, fast text mode)! But I guess this is a pipe dream...

I'm not sure which ST Word Processors the writer knows about. OK, 1st
Word Plus still expands tabs to spaces (although you can use indents in
some cases to get the same effect as a 'normal' tab), but its printer
support isn't that bad.

I'm not sure if the writer thinks the ST version of WordPerfect is lousy
or whether he doesn't know it exists. I don't like it much, but I'll
admit it's improved over the years. (Now if only the UK would get the
US updates faster..)

There are others with a reasonable spread of features (though I've not
tried all of these): Wordup, Script, Protext all come to mind. I
discount Microsoft Write, which is an unfinished, unloved and
unsupported botch. It would be nice if someone would translate Le
Redacteur into English: version 3 looks to have all the sophistication
demanded by the writer, and friends who've used it say they won't go
back to anything else.

The trouble is, of course, that these products are not well distributed
in some (most) countries. The software is out there, but getting it to
the users is difficult.

Well, as Mauritz said, even the low-end Ataris aren't incredibly cheap anymore. But what I was talking about, were mainly NEW computers with at least a 68030. The comparable models are A3000, Mac IIsi and Atari TT. I suppose that these all will be priced about the same in the US.
I am not interested in
the low-end Atari's since they are quite old technology and I already have a MEGA4. I can't make up a good reason to choose an A3000, TT (or

even an IIsi) over the NeXT because for the same price I can get a n-times more effective and valuable machine. IF Atari TT's would-be price was about $3000 AND you could get a reasonable EDUCATIONAL DISCOUNT, then I could consider buying it.

But I can't continue supporting Atari only because they did some very good things half a decade ago...

(If I had enough money I would keep the MEGA4 as a MIDI-platform on the side of the NeXT. The best thing would be to get an Atari comparable to the NeXT for the same price...)

Jouni

In <1990Oct18.144010.6612@rodan.acs.syr.edu> mjducey@rodan.acs.syr.edu (Matthew J. Ducey) writes:

>What is Minix? Where is a .doc that will explain this to me?

MINIX is a UNIX(TM)-like operating system replacement for the IBM PC/XT/AT, the Atari ST/Mega_ST and meanwhile for the Amiga (A2000 only) the MAC (MacMINIX) and lots of other systems. The ones listed here explicitly are those you can get a commercial version for from Prentice Hall.

MINIX is a lot like System 7 but after being patched to MINIX 1.5 it has more and more enhancements to it. There are efforts going on to make it as posix-like as possible. However, it was basically written for OS courses. Currently there's a discussion in comp.os.minix on where MINIX should be heading and how to keep the readability important for OS courses while adding features which would be USEFUL.

There's no doc file. There is, however, a so-called MINIX Information Sheet which is posted regularly in comp.os.minix (you should be reading that group as you may notice). The latest version I have is dated Oct. 3 (mtime on my machine!). I can mail that to you if you're interested. I'm not going to post it since I'm not the one who maintains it and it is as I mentioned, posted at regular intervals in comp.os.minix.

I hope this helps all of you who've been asking the above question.
Have fun

2725. PD distributors

Newsgroup: comp.sys.atari.st
Date: 1990-10-20 18:45:21 UTC
From: a1318@mindlink.UUCP
Message-ID: <3605@mindlink.UUCP>
Source record: 237845

This is primarily aimed at the software(especially the shareware)
authors we have reading the net.

I have noticed that many of the programs coming across the net
will not allow their distribution by way of PD software
distributors.As well,some do not will their software to be distributed
on commercial systems such as Genie and Compu-serve.

I wish to know why such a prejudice?(No flame,I am just curious)

What is it about PD distributors that authors don't like?While I
am not connected with any such distributors,I will admit I have
thought along such lines and as such would like the authors point of
view.

Is it that most distributors after purchasing disks,checking out
the programs,cataloging them,creating some sort of sales catalog,etc.,
try to make a profit on the disks to cover their time and effort?

The reason I ask,is for several years I was without a modem as
well as being a long distance toll charge from any user group or
BBS.My only option was such distributors and with one exception I
found their prices for their time and effort to be reasonable.I wonder
wether some authors understand that the reason distributors exist is
to provide a service that people want(or in my case,needed).I would
think that for a shareware author,the widest distribution would bring
the best results.

Since my interest is strictly for the ST,I thought I would ask
here,but since this post is not of general interest(I don't think
:}),I would ask that all replies be by E-Mail to save bandwith.

My thanks for your time and considerations,

Kent Cavaghan

P.S. Please,no flames;at this point I am just curious about some
seemly contradictions.I will sumarize to the net if there is enough
interest.

[He continues to say taht you can't do anything with a 512k St w/o hard disk.]

>Ahem, you CAN buy a Mac Classic with a 1.2 meg disk drive, 1 meg RAM
>with its own little monitor for $749 (Computer Era in NYC). You get
>a ready to use system (keyboard included too) for this with a friendlier
>OS and more software support.
>

So, Chris, you complain about repackaged the STE as 5 year old technology and then suggest a Mac Classic?!? You also said that an ST system w/o hard disk was useless. At least an ST won't make you swap disks every two minutes to load in another hunk of the operating system. True, with the exception of the stereo sound, the STE is basically a slightly faster (Blitter, TOS 1.6) ST, but the Mac Classic is a slightly faster original (128k) Mac with more memory.

Also, please note that you can bump an STE up form 1 Meg to 4 Meg for about $200. I did so with mine.

I'm not going to get into the OS debate here, but a floppy based ST system is definitely useful. Unless you need to do a lot of compiled programming or a lot of heavy stuff, STs are perfectly useful with only a floppy.

Your comments about the STs needing a monitor and the Mac CLassic coming with one are valid.

Welcome to atari.archive.umich.edu

This is the first monthly posting from the umich atari posse. We hope
it will answer some of those nagging questions that always seem to pop up
from time to time. If you have any additional suggestions, please mail
them to me, at weiner@atari.archive.umich.edu.

1: How do I use BART?
Bart (Brode's Archive Retrival Thang) is our mail server. You can get
his help file simply by asking for it. Mail atari@atari.archive.umich.edu,
and type the word help in the body of the message. Further questions about
BART can be mailed to jon@atari.archive.umich.edu, NOT me.

2: How can I connect via FTP?
Well, we have an FTP help file too....Again, mail BART and he will send it
to you. Try atari@atari.archive.umich.edu and enclose 'send ftphelp'
in the body of the message. Further questions about FTP go to me,
weiner@atari.archive.umich.edu.

3: What if my machine doesn't support name service?
Two things to do here:1) Demand that your sys-admin install it soon,
and 2) use the internet address 141.211.164.8

4: I can't download because my hard drive doesn't work and my modem goes
out sometimes and .....HELP!!!
Sorry, outside of the archive I really can't help you....Your best bet is
to find someone at your site with a similar set-up, or post to c.s.a.st
for advice.

There are a few files that you will find necessary to continued archive
usage, namely:

archivers/arc602.arc : The latest version of arc
archivers/zoo.arc : The classic archive program
archivers/compress.zoo : Useful for removing .Z from sounds and binaries
archivers/unlzh11.zoo : Unpacks .lzh files

Some of the latest uploads:

Oct 6 14:20 24bit.arc -> ../utilities/24bit.arc
Oct 18 20:18 arcgsh32.zoo -> ../archivers/arcgsh32.zoo
Oct 1 19:22 atarimgr.zoo -> ../utilities/atarimgr.zoo
Oct 18 20:18 djstuff.arc -> ../printing/djstuff.arc
Oct 7 16:00 dvidrvx.zoo -> ../tex/dvidrvx.zoo

```
Oct 18 20:17 firstbas.lzh -> ../applications/firstbas.lzh
Oct 3 21:16 gimmicks.lzh -> ../misc/gimmicks.lzh
Oct 7 16:01 gnupltx.zoo -> ../graphics/gnupltx.zoo
Oct 3 21:13 graphiti.lzh -> ../graphics/graphiti.lzh
Oct 15 19:32 life.zoo -> ../games/life.zoo
Oct 15 19:32 lifeuniv.arc -> ../games/lifeuniv.arc
Oct 1 19:23 mgrdemos.zoo -> ../utilities/mgrdemos.zoo
Sep 20 12:53 mint06b.zoo -> ../utilities/mint06b.zoo
Sep 20 12:53 mint06s.zoo -> ../utilities/mint06s.zoo
Oct 4 23:43 mntlib03.zoo -> ../gnustuff/tos/mntlib03.zoo
Oct 7 16:22 pbmchess.arc -> ../games/pbmchess.arc
Oct 15 15:34 pfx.zoo -> ../archivers/pfx.zoo

Thanks to everyone who has uploaded anything lately.....

PLEASE NOTE: FTP and BART service are a privelege, not a right! Please make
a supreme effort to keep heavy FTP and BART use in off-time hours (i.e. after
5 pm EST but before 8 am EST).

Any ideas, questions, comments, etc. to me,
weiner@atari.archive.umich.edu

2730. BART Help file

Newsgroup: comp.sys.atari.st
Date: 1990-10-20 21:10:31 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1990Oct20.211031.4729@terminator.cc.umich.edu>
Source record: 237850

```
The Umich Atari Archive Help File

Welcome to BART, Brode's Archive Retrieval Thang, Terminator's Atari mail
server. To use the server, send a message to atari@atari.archive.umich.edu.
The subject line is ignored. The body of the message should contain, one per
line, any of the following commands. Each of the commands sends its output
back to you via mail.

"help"
This command tells BART to send you this file.

"index"
This command tells BART to send you the Index.
Currently, the index is a listing of all the files
int the Atari area. Descriptions of various files
can sometimes be found in the Index file of each
directory. These must be requested individually
with the send command. They are currently incomplete,
but it's all we have for now.

"path mail-address"
This command tells BART where to send the requested
files. This is useful for specifying a mail path.

"send directory/filename"
This is the command that sends out files from the
archive. The server only lets you get files from
the ~atari hierarchy so you only have to specify the
subdirectories in the atari tree. You can determine
the path and filename from the Index file. For example,
if you wanted to get arc, you'd send a message with
a line in the body that looked like
send archivers/arc.ttp
to get the index file, use
send Index
Binary programs are uuencoded before they are sent
out. If you miss parts of a file, rather than re-request
the whole thing, you can give BART a comma separated
list of the parts you are missing and it will send you
those parts. For example...
send languages/gcc.arc aa,ac,af
This is the only way to get files larger than 400K.
You must request the file by parts until you have the
whole thing.
Note: BART does not accept wildcards such as ? or *.
```

"sendb directory/filename"
This is similar to the send command except that it
always uuencodes the files that it sends out. Send
tries to determine whether it is sending a binary
or ascii file and only sends uuencoded messages when
necessary.

While the commands are not case sensitive, the filenames are, so be
careful you are using the correct case before complaining that the server
is broken.

You are limited to 400k and/or 5 files per day. It takes 24 hours from
the time that bart received your last message to clear your quota
records. BART does not queue requests that went over quota and send them
out later. You have to re-request them 24 hours later.

BART tends to ignore your mistakes. You will not receive a message back
if you gave an illegimate command or specified a bad file name. This was
a deliberate design decision. It may not be user friendly, but it keeps
the mail queues short and prevents a couple other nasty things.

Submissions are always welcome. Please mail them to
weiner@atari.archive.umich.edu

>I'll bite" it proves my original statement that most people on the net are
>to cheap to consider buying commercial software, and it is only by offering
>it to them on a silver plate that they respond.

NO! The only thing this proves is that many people tried your earlier
shareware versions of QuickST and couldn't stand all the extra bugs it
added to an already buggy TOS! No one wants to PAY for software that
that is incompatable with any of the other software they commonly use,
even if its only ONE program.

> ... Quick ST II is one of
>the best selling pieces of software for the Atari ST, ever. That is why I
>can afford to sell it for $20 and still make a healty profit.

So despite your obvious hatred of us CHEAP SH*TS who read and post to the
net, you are still willing to boast about how Atari ST users are lining
your wallet (in addition to what ever Microsoft pays you).

> If you have anything
>further to say, please do so in private email and stop wasting bandwidth.

Yeah, it's OK for you to post large flames towards others, but not for
others to post flames towards you.

Hi,

auf meiner Pladde sinn zwei neue Spielsachen fuer Mercury-Anwender.

KILLJUNK (Fetzt die ng junk von der Pladde und raeumt auf.)
WHOAMI (Gibt die Antwort auf die uralte Frage; Wer bin ich?)

Beide Teile sind "hard 'n' dirty" programmiert. Environmentvaraiblen
werden nicht verdaut. der etc-folder wird auf dem root des Default-
laufwerks unterstellt. Ohne config.sys loeppts nich.

Wer 's trotzdem hamm will, bitte msg an server@clubber.stgt.sub.org
(Habe reply to so gesetzt...)
Im Message-Body (Also nich im hedder, gell Gert?!) sollte
send mercury.tls
stehen.

Das File is ca. 25 Kilo lang und wiegt etwa ein Meter. Kommt
uuencoded und gearct. Laeuft mit Mercury 1.16

2738. Jove for the ST

Newsgroup: comp.sys.atari.st
Date: 1990-10-21 21:16:43 UTC
From: depeche@quiche.cs.mcgill.ca
Message-ID: <5353@quiche.cs.mcgill.ca>
Source record: 237758

I've been using JOVE for my SUN, for MS-Dos and also for the ST, but the ST version is not as reliable as most of the other versions I've seen. It bombs periodically, especially when I try to access the describe-command type commands, and sometimes it can't figure out what its own directory is, etc etc...

I set environmnet variables from BOTH Neodesk and Pcommand, because I don't think JOVE knows how to access the ones from Neodesk when I am in pcommand (?)...

Anyway, is anyone else having similar problems? I am using tos 1.4, btw...

First thing, we are no longer the terminator archive. Our machine is
properly called atari.archive.umich.edu. (the fact that it happens to
be on terminator is irrelevant)

Second, send a message whose body contains only the word "help" to
atari@atari.archive.umich.edu. You will receive instructions.

From: archbold@bluemoon.uucp
Message-ID: <LNZeR3w163w@bluemoon.UUCP>
Source record: 237764

Ok, John and others who agree with him on bashing Darek Michocka:
For one thing, there are lotsa people who'd like to have his Quick ST II and I don't appreciate such strong developer bashing as you try to pass onto us. I think that Darek Michocka has done alot for this ST world and he deserves a little respect in that light.

So, please, if you don't like Quick ST II or Darek, speak for yourself and let a good developer do his work. I think you're turning developers away by such posts, and we do need them you know...

UseNet was the place where I found out about Quick ST II and thanx to that I'm gonna be able to get it. I usually get most of my info off of this medium of communication, so I think that Darek's choice of posting here was pretty good.

On the other hand: Darek, I didn't like the way you got on someone's case when s/he tried to get some info about pd programms which would put a picture on desktop...

Anyhow, send flames to:

But read the fine print. The $750 Mac Classic does NOT include a hard drive and that price is often available if you purchase the "Mac Classic Package" with the hard drive and a printer - bumping the price to a lofty $1,499, otherwise you'll pay $850-900 for the Classic. (and every try and use a Mac off floppies? we're talking 43 disk swaps to copy a disk...)

Source record: 237771

```
- Also, I tried using BGACC with MiNT and it gives me two bombs when I
- get the item selector to run a prg in the backround. I only had
- Folder300.prg in the auto folder with MiNT following, and no other
- prgrams or accs. The only other thing that was installed was my
- hard disk autobooting driver, the Atari one that came with my
- Megafile 44. I am using TOS 1.4. Does anyone have any suggestions?
- Thanks very much!

I had this occur also, but when I didn't have UIS III installed.
When it wasn't installed I got the two bombs. When I installed it
from the AUTO folder, I didn't get the two bombs, but I still got the
regular file selector, no UIS. Weird. BTW, BGACC and Mint is nice!
I don't use Mint at all, but I wanted to try out BGACC. I was
running Forem through BGACC. Text display was kinda strange, but
everything worked okay. I need more memory though. It was REAL
tight on a meg. FYI, I have an STe with ICDBOOT 4.8.4.

It's totally optional. Normally the menu is present. The ALT key is
used only if for some reason you don't want the menu most of the time
but want to invoke it occasionally.

dit@frenzy.sybase.com (Stone Cold Mackin') writes:

- I am looking for a program called Micromix one, that takes samples
- from the M/A/R/R/S song "pump up the volume", and lets you mix them
- yourself.. a couple of years ago, Micromix II was posted to the
- net, so it follows that someone should have it (??).. anyway.. Oh
- yeah, if there are any other demo programs comparable to the
- Micromixes, or Lost Boys of London Demo, I would be interested in
- those too.

MicroMix I doesn't allow you to mix the sample like II does. I don't see why you couldn't swap samples though -- put the sample from I into II. I can upload it to atari.archive. Also, I think the Lost Boys of London demo is already there (as well as many others). If not, I can send it too.

2756. gcc and MT C-Shell (repost)

Newsgroup: comp.sys.atari.st
Date: 1990-10-24 16:48:34 UTC
From: david@doe.utoronto.ca
Message-ID: <1990Oct24.164834.21929@doe.utoronto.ca>
Source record: 237776

I have noticed a query about using gcc under RTX (MT C-Shell).
I posted this message a couple of weeks ago, but here it is
again (slightly modified at the end):

(cut here)
==========

A few days ago, I posted my suspicion that it was the freopen()
function which keeps gcc-cpp.ttp from running with MT C-Shell
(under Micro RTX). I still have not seen the gcc-cpp.ttp source,
but I did try out this test program:

```
#include <stdio.h>

main()
{
FILE * fp;

fp = freopen("hack.txt","w",stdout);
if( fp )
fclose(fp);
else
fprintf(stderr,"Cannot open hack.txt\n");
}
```

The program runs under TOS and MiNT, but not under RTX (which prints the
error message). The reason is that the Gnu freopen() function in this case
attempts to close the standard handle associated with stdout, which
(correctly) causes an error under RTX, while TOS and MiNT are a little
more lenient.

NOTE: compress.ttp also suffers from this problem (the one from
atari.archive in atari/gnustuff/tos).

PATCH:

Here is a little patch for the close() function in a compiled GCC 1.37
program. Note that this may not work for you, and may even cause the
program to malfunction! Use with care, and back up your originals. What
the patch does is simply have close() return no error even when there is
one.

Search for the following bytes with your binary editor:

```
3f 3c 00 3e 4e 41 58 4f 34 00 48 c2 6c 0a
|
74
```

Change the byte indicated from 34 to 74 (make sure that the _entire_ string
is correct first). Instead of copying the return value from Fclose() from
a0 to a2, this patch has the function set a2 to 0 (success) in all
circumstances.

SUCCESS:

compress.ttp does not complain about errors opening files when this patch
is applied, but I have not tested it past there.

gcc works, but it needs a little more help. You will have to set the
tpa to a higher value before you run it (see the shareware RTX
release for details on how to do this). I set it to 512K and gcc
seems to run fine, at least with smaller programs. With larger
programs or hyper-optimised ones, you may need to set the tpa
to 1024K or greater (the default in MT C-Shell is 64K). Remember,
gcc needs A LOT OF MEMORY. Give up on running it under MT C-Shell
(or, probably, MiNT) on a 1 meg machine. The Sozobon package is
rather simplistic, but it will run nicely in a smaller memory space
(it does not work as-is under RTX, though, because of a nasty
DLibs bug!!!).

>
> I am using a Panasonic 1091 printer with a 520ST and I am
> having problems printing with it, especially in graphics print
>
> first, it is leaving random characters when you print normally
> (like from a word processor)

Hope this gets out... I can't help you on that one, check if straight ascii files print ok. If so, you probably need to make or modify your programs' printer drivers to use the correct ESC codes, but read below.

Secondly, and more obvious, when
> I do a screen dump (Pressing Alt and Help) I get a line of
> the screen followed by a line feed, so on paper you get the
> picture of the screen, except it is striped because you are
> getting a linefeed at the end of each line (so it is twice as long in
> length on paper) Does anyone know what to do? Like DIP switches or
> the like?

> Thanks
> Saurabh

This is an old problem, back from the begining of STdom. The screen dump really only works for printers that emulate the IBM (originally rebadged Epsom MX with graftrax) 9 pin printer series. You can have a substitute driver for the screen dump in your autofolder - for better resolution or a different default size or a really oddball printer - but if you use it rarely, just put your printer into IBM emulation (with an Esc command or by means of a dip switch - read by the printer when it powers up). I used to do this routinely for my Star SG 10 and screen dumps *still* work on my new Citizen GSX140 (24pin) when I put it into IBM Proprinter emulation. The problem is that the (emulated - usually 8-) Epsom does not get its linefeeds reset to just 8 pins down (only 8 are used in the graphics modes) by the ST's dump code. The same commands on the IBM side *do* shrink the size of the linefeeds.
In your case, you have a 9 pin printer, so you could just leave it in IBM mode, which is what I did with my SG10. Be warned however, most software that needs a printer driver, GDOS programs especially, was written by people who believed Atari when it said that the ST was compatible with Epsons. They only give you a driver for the Epson mode of your printer. You could end up writing or scrounging a lot of printer drivers.

Good Luck, (posted for the benefit of those who didn't know about the 24pin screen dump trick 8-)

2760. DVI sought...

Newsgroup: comp.sys.atari.st
Date: 1990-10-24 20:35:09 UTC
From: jeroen@plato.phil.ruu.nl
Message-ID: <884@accucx.cc.ruu.nl>
Source record: 237780

Since I'm graduating and have to typeset LOTS of formulas I thought I might as well install a TeX system on my ST. So I looked in my disk collection and on the net, and found about 6 more or less complete TeX systems. Trouble is: I found one DVI program I *REALLY* liked, but ... It is a universal DVI driver that user a custom format for font libraries, and I only have the screen fonts.

The "About myDVI" dialog box says:

myDvi
a universal DVI driver
Atari/Pixel implementation
Version 1.1w
(c) 1986, 1987 Edgar Fuss

If anyone can tell me where to get the rest of the font libs that go with this DVI, I'd be very pleased!

Please answer to jeroen@phil.ruu.nl, thanx, J.

> method is doing me harm. Thanks in advance.

I always use a huge RAMdisk when I'm doing floppy copies. That way I only
have to swap once.

I heard that TOS 1.4 does it right, using all available RAM as a buffer to
minimize disk swaps, but I havent' gotten up the nerve to try it yet.

If what you say is true, it's a feature in the newer releases of WP 5.1.
The versions I used (about 6 months ago) did not start up with the mouse
menus. In light of this new information, I stand corrected. It _does_
look really ugly, though, unless they've changed that, too.

2763. Re: Quick ST II Challenge!

Newsgroup: comp.sys.atari.st
Date: 1990-10-25 01:04:06 UTC
From: david@bdt.UUCP
Message-ID: <5948@bdt.UUCP>
Source record: 237783

[I'm not including text from any of the articles on this thread to keep this message short. Refer to the referenced articles if you haven't followed this discussion.]

I just want to say that flaming on both sides of this "Advertising on the net", "Atari users are cheap", and "wasting bandwidth" debate is getting out of hand.

Often it seems that the people that complain the most about incorrect use of the net are the very people that are getting the net for free, and have nothing to do with paying the usenet bills.

I am the site admin for our site on the net. The net isn't "free" to me by a long shot; I write the checks each month. Yet I still appreciate how much is done free-of-charge by all the upstream sites that forward mail and news for me. I know how much the total cost of each message must be by the time it's sent everywhere. But I still feel that small "commercial announcements" are no big deal. Anything done in a reasonable way (short and sweet), seems perfectly OK to me. Of course, this attitude will offend many net "purists", but I still argue that these aren't the people paying the bills. I certainly should have more say about what constitutes abuse of the net than an average reader, becasue I at least have to pay to run my site and I pay for all its network connections.

Also, don't forget that the ST market is small. There's only so many developers and only so many products. I know that if somebody comes out with a new product, I like to see an announcement on the net. I am more likely to see it and read it, than if it appears in an ST magazine. Many small companies can't afford to advertise large enough and often enough for me to catch their ad, so a small net posting might be the only place I see mention of the product, especially since the ST magazines are so awful about getting press releases out.

On the other hand, I think Darek needs to mellow out a bit. Those of you that saw my postings from a few years back, may have noticed quite a change in tone and content (I hope for better). I know at one time I was in a lot of KILL files :-)

Anyway, in summary, I think a few of you are jumping on Darek a little hard, and I also think that Darek has been a little hot-headed too. Both sides may have valid arguments, but they're getting lost in the shouting.

2764. Lotsa stuff sent to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1990-10-25 01:12:27 UTC
From: ekrimen@ecst.csuchico.edu
Message-ID: <1990Oct25.011227.16452@ecst.csuchico.edu>
Source record: 237784

The following files have just been sent to atari.archive.

18304 Oct 24 15:55 ck_demo2.lzh - Demo of Codehead's Codekey macro tool
58624 Oct 24 16:00 dcudemo.arc - Demo of DC Utilities 2.0.
(Mike V., I thought YOU were going
to post it. :^)
156032 Oct 24 16:13 dlxpaint.lzh - Demo of Deluxe Paint for the ST.
Supports STe's 4096 colors.
5632 Oct 24 16:00 steplay.lzh - STe Noisetracker module player.
This was posted to comp.binaries
by Lars-Erik Osterud, but I thought
I'd send it to atari.archive. The
sound is incredible! (Lars-Erik, any
chance of getting one that runs in
the background? :^)
51840 Oct 24 16:17 tcbsound.lzh - The Carebear's Soundtracker demo.
34048 Oct 24 16:21 cheetah3.lzh - Version 3.0 of the SUPER FAST file
copier. Great with hard drives.
Supports BGM partitions.
96128 Oct 24 16:34 pl_demo.lzh - Demo of Codehead's PopIt! and
LookIt! PopIt! "hotwires" your
desk accessories so you can call
them with a keypress. LookIt! is
an extensive and fast (and HUGE)
file viewer/editor.
41096 Oct 18 15:22 ballzone.lzh - Pretty good Arkanoid (Breakout) clone
Don't know if it works in
monochrome. (BTW, anyone know of
a mono emulator for the STe?!?)
48773 Oct 18 15:59 conquer.lzh - Playable demo of Conqueror, a
strategic tank simulation.
198110 Sep 30 18:55 daythund.lzh - Playable demo of Days of Thunder,
race car simulator.
130457 Oct 6 14:47 flyshark.lzh - Playable demo of Flying Sharks.
111167 Sep 30 18:55 manix.lzh - Playable demo of Manix, a game
like Crystal Castles (I think that's
the name of the game) but better
105991 Oct 13 17:32 monarch.lzh - Good looking demo from Portland, OR.
213760 Oct 14 05:30 neworder.prg - New Order demo from Europe.
Scrolline and good music.

Yeah, I had some free-time this afternoon. :^) Enjoy!

2765. LaTeX on ST

Newsgroup: comp.sys.atari.st
Date: 1990-10-25 01:33:37 UTC
From: <>
Message-ID: <1990Oct25.013337.2389@cs.utk.edu>
Source record: 237785

I would like to install LaTeX on my ST. I was hoping it would be an easy
task, so I tried uploading TeX arcs from terminator.cc.umich.edu.
I made sure I had all the files required, and ran INITEX.
And that's where I would always get stuck: INITEX munches along trying
to build LPLAIN, processes all the input files (such as lplain.tex,
lfonts.tex, hyphen.tex, etc.) and at the end gives me the '*' prompt, asking
for a command or \end. I don't know what to do at that point! I tried
everything, but I never succeeded in creating LPLAIN.

The documentation provided with those arcs is very brief, at best, and
I am (obviously) not familiar with the installation procedure for LaTeX.

Can somebody please enlighten me as to what I am doing wrong ?
Are there some well-documented LaTeX arcs available via ftp somewhere ?
I could probably deal with C source files, instead of binaries, since
I have the LaserC compiler. More detailed instructions would help
greatly, too.

I would really appreciate any help with this. Thanks in advance --

This is not a flame, so if I go off the deep end, just realize who is posting the message. <grin>. I too would consider myself to be one of these pd/shareware authors who included notices in his software that it may not be distributed by PD software distributors. That was one (of MANY) reasons why I abandoned shareware and went commercial.

I have had bad experiences with a number of such PDSDs. I will not name any names since some of them might read this, but they include some well known ones that advertize in Atari magazines, some Atari magazines themselves, and user groups.

The idea itself seems quite simple. Collect PD software, catalog it, put it on disks, and then sell it for a profit. However, most people who try it turn out to be complete morons who don't know what they're doing. A few of my programs that hace suffered through this process are ST Xformer and Quick ST (the original, not Quick ST II).

For example, with ST Xformer, there were 4 really major releases (1.2, 2.1, 2.3, and 2.5). Back then (1987 through 1989) I had this silly notion that most Atari ST users had modems and would be able to download this software from their local BBS or from Compuserve/GEnie/BIX etc. This of course, was a bad assumption. What started to happen is that most people got it from user group libraries or from these mail order PDSDs. I would start getting phone calls from peole telling me the software wouldn't boot up, and when I asked them about it, it turned out that files were missing, documentation was missing, etc. The problem with Xformer is that there were several megabytes of files associated with it (executables, data files, doc files, etc). What most PDSDs did was try to pick out the most important files and cram them on to a 360K or 400K disk. WROOOOOONG!!!

What really pissed me off was when I released an update, they would either ignored the update and keep selling the old files (why the hell did I bother to make an update then!!!) or they would mix old files with new files, or worse, they would continue to sell both versions. WHY!!!?!?!?!?!?? Can they not simply remove the old disk and replace it with the new?

And then of course, I got steamed because people who purchased ST Xformer from a PDSD would call me up at 3am and bitch about the problems, and when I explained to them that if they sent me the $15 shareware fee that they would receive complete docs and complete software, they would tell me to f*** off because they've already PAID FOR THE PROGRAM AND WHY SHOULD THEY PAY AGAIN?

I had a guy come up to my both at the recent San Jose World Of Atari demanding that I give him a free copy of the ST Xformer user's manual. First of all, I didn't have any on me, and secondly, just because he got the software for free doesn't mean that he's entitled to free manuals.

Even though ST Xformer 2.5 has been out as PD for over a year, a lot of the PDSD and boards don't have it. They have an old version of Xformer. What really gets me is that Atari had threatened to sue me over ST Xformer, saying that it was illegal, and that I couldn't sell it commercially. Yet many of these PDSDs get away with charging $5 or $10 for a copy of the software. I was at one Atari ST dealer in Michigan who had a copy of ST Xformer and the manual on his shelf for $49.95. And now with these ST Xformer Cables, there's guys out there making thousands of dollars selling them and the software, and I don't make one single penny from any of this. Am I pissed or what??

There is one mail order Atari dealer currently running an ad for the ST Xformer Cable and in the ad it states that even though the software and cable are PD, they will give me a share of the profits. Right in the ad! Well, considering that I have never been contacted by these people or received any money, and that they have been running this ad for months, I find it EXTREMELY hard to believe that they have not sold one single cable. They are, just like the rest of the PDSDs, ripping me off.

And of course, with Quick ST it was a similar situation. Most PDSDs simply couldn't handle updating their disks eveyr month with newer versions. Most of them also labeled the software as PUBLIC DOMAIN, which it was not. German PDSDs especially have done a lot of damage to me. Some of the German ST magazines I've seen carry ads from PDSDs who claim to have "exclusive

distribution rights" of Quick ST in Germany. That's complete BS!! They sell the shareware versions for $20 or so, or spread them around as PD, and of course when I went commercial with Quick ST II, it took almost a year to convince someone to distribute Quick ST II commercially. Only now is Quick ST getting the serious attention from German magazines.

In the US and Canada, I had a bit more control over Quick ST and managed to get the word out a lot faster about its conversion from shareware to a commercial product. However, there are still ads in magazine that I see from people selling Quick ST 0.8 (a beta version!!) or Quick ST 1.2 etc. These are 18 month old versions that have been superceded by at least half a dozen newer shareware or free demo releases.

And that is why I am pushing the Quick ST 2.2 DEMO so heavily. Otherwise these idiot PDSDs will still be selling old versions.

So, if I seem negative about PDSDs, I AM! And every other public domain, freeware, or shareware author out there SHOULD BE CAREFUL!!!

And I didn't even get into what I think of these self-proclaimed "sysops" that run your local ST boards. Geez, I had one guy call me up a few days ago asking which versions of Quick ST he can put up on his BBS. He just could not get it through his head that when I said "none" that I meant NONE!! He didn't want to post the Quick ST 2.2 Demo, since it was a demo, and instead wanted to post Quick ST 1.4. (1.4 is MUCH MUCH slower than the 2.2 DEMO, so where this bozo's logic was, I don't know).

The only PDSDs that I recommend are the online services like GEnie, Compuserve, Delphi, and BIX. The reason being that I, as an author and user of the service, have complete control over what files are posted and which are not.

I will NEVER again get into writing shareware. I don't fell like putting money into other people's pockets. Since its conversion to commercial status, Quick ST has outsold its shareware counterpart by a factor of 20 to 1. Too bad I can't do anything about Xformer, because I'd love to keep hacking on that, but bills have to be paid.

Try DCOPY, which should be available from any archive site.

The login in mx2 does not allow you to protect directories, just to
have various logins vor various people--mostly useless, in other words.

>Does anyone have any suggestions? Thanks very much!
>
> Michael Rose

Whoops! I hit R instead of F and mailed this when I wanted to post it.
Soooory.

Currently, BGACC will only run .TOS programs. The source code was
posted to comp.source.atari.st, and I picked it up yesterday, hoping
to make it work with .TTP programs. I may actually get around to
this sometime soon, but don't hold your breath.

Now for my question. I want to be able to run a terminal program under
MiNT and (hopefully) MGR. My fully functional copy of C-Kermit runs
under both, and accepts input from the remote machine. However,
nothing I type is echoed or noticed on the other end. Are there any
special settings I need to make, or is there another terminal
program that works?

Source record: 237793

In article <ROEDER.90Oct23153846@robin.cs.uni-sb.de> roeder@robin.cs.uni-sb.de (Edgar &) writes:
The quicklock program and accessory allows you to write- and/or
read-protect some partitions of your harddisk. With a single password,
you can reenable the read/write-access to the partitions. This gives
you two levels of permissions. People knowing the right password can
access everything, others have only restricted access to some
partitions.
We use this system at the university to prevent (accidental) damage of
our program and system partitions.

Hope this helps!

- Edgar

This utility sounds very interesting. What is its distribution
status, and where is it available or how much does it cost?

I don't know what "LUN" stands for, but...
The Megafile44's DIP switches are accessible without opening the cover and violating any warranty. Personally I have driven a Megafile44 both as drive 0 and drive 1 without any problem.

|> 2) is there a significant speed difference in disk access, either relative

|> probably 65 ms or so.

28 ms. However, if you are concerned in speed get TOS 1.4! With older TOS versions you will hardly notice any speed difference between 65 and 28 ms.

|> 4) will i need to change drivers (ahdx 3.01) to accomplish this? if so,
|> what will i need?

No, Ahdi 3.01 is fine.

On the subject of disk file manipulation, I would like to implement a move
command which, if the target is on the same floppy as the source, re-links
the directory entries rather than doing a copy/delete. Is it possible to
do this or will GEMDOS buffering confuse things? If buffering is a problem,
is there a way to tell GEMDOS its buffers are no longer valid?

Dave.

I would think that Gulam would provide some sort of protection like this?
If not, maybe you could try Minix for the ST. I found MX2 to be a little
on the unstable side.

This is no problem. Simply use the Frename() system call.

According to a recent news article, NeXT sold about 7,000 machines in their first year. This does not appear to be enough to support large scale application development. I agree that the NeXT looks like a very nice machine and the price is becoming very attractive, but at the rate they are selling I would expect new software to appear much more slowly than it did for the ST. I realize that several very nice software packages are now available or will be RSN. If these are sufficient, or you spend most of your time programming for yourself, the NeXT could be a good choice.

You have to select the menus in setup. Shift-F1,2,4,8 is the sequence
to leave the menu bar visible. You can also change the appearance of
the menu.

I suggest that further queries about WP 5.1 go to a PC group.

Re: Quick St Challenge.
Over the last year we have seen the Dc Desktop Demo posted to the net, and plugged by it's author, also we've seen David Beckermeyer recommending his own packages to users. And we've seen no complaints about bandwidth wasting or the death of the net as we know it. I rather suspect that if Darek hadn't got his foot firmly lodged in his mouth recently concerning a reqi`uest for a program which happened to do one of the things Quick ST does, we wouldn't be seeing any complaints now either.
I for one like to see developers discussing their products on the net, as it is a welcome releif from B.S. stock analysis's and inaccurate reveiws of Mac Classic pricing. The same goes for Darek's recommendation of Excel. If anyone else had recommended it, we wouldn't have heard a peep out of anyone. Maybe Darek could draw a lesson from this on posting style, as as his main antagonist obviously can't learn anything from anybody.

Re: Putting someone in your kill file.

Step 1: First you need a kill file. Hit shift k to kill any article and
save the results to a kill file.
Step 2: Hit control K to edit your kill file.
Step 3: Change the kill file to have this line in it.

/cmm1@cunixa.cc.columbia.edu/h:j

Resave the kill file and you're done. This will work for any messages
posted from that account. The h means that the header is searched for the
string in the slashes. As long as Chris posts from that account,everything
works fine. Note this only works for rn and it's relatives.

If you realy don't want to read anything to do with Chris, try
/Mauritz/a:j
This will kill any article with the string Mauritz anywhere in the
article.

enjoy
John Henders

> PageStream V 1.8 for sale. The best DTP program for ST.

I am a PageStream owner.

I got the stuff home and unwrapped it. The documentation is
useless. Not only can you not find what your looking for in
many cases it is just wrong.

But, hey no one *really* reads documentation do they? After
playing with it for a couple of weeks, I think I got a handle
on the thing; and some questions - and comments.

So I call Soft.logik (the name should have been enough to
warn me). I finally got through to support. This took 2
days. I said hey did you know you spell check doesn't work?
They said gee it works just fine here. I said gee that is
interesting but it defentely panics my machine. You get
address errors. They said oh no not us. I said did you know
that you dialog boxes are all wrong? They said hug? I said
yea - really.
Are you at a machine now? Well export some
text. Now what does that box say. hugh? THE
******* BIG BOX IN THE MIDDLE OF THE SCREAN THAT
SAYS MODIFY ALL TEXT ? That is a dialog box, and
it is wrong.

Well may be, but there is nothing I can do about it.

So, hey I can't use the spell checker *at all*, the documentation
should have gone in the trash along with the registration for all
the good they did me. Sooo, I export my document in ascii and run
a MW C speller. I hobble a long.

Now I am trying to prepare notes for a UNIX internals class. Now
I need multiple files open and these files get to 30+ pages each.
Now *everything* panics. You got it. Your working along cutting
and pasting - and the next thing you know three bombs.

Soooo. Finally I figure that maybe just maybe the GEEKS have wised
up. I give them a call. This time I get straight through to support.

Hey I have your stuff and it doesn't work. Do you
have any fixes?

Yea, we got a *brand new* version! Why haven't you
upgraded.

I don't particularly want to through good money after
bad. Look I gave you guys a fist full of money already -
for shit that don't work. What bugs did you fix between
releases. I would consider upgrading if it fixes my
problems.

The bugs are too numerous to mention.

Thats odd when I called you a few month ago you told me
you had no problems. That I must be doing something
wrong.

Well I can't do anything about that.

Well, look have you fixed you panics and the spell checker?

We did a lot of work on the spell checker. What is a panic.

You know bombs - BOOM, ALL WORK LOST.

Well, our code doesn't do that. That would make it useless.
I have written literaly hundreds of memos with this and never
had a problem.

Gosh, a *whole* memo hugh? I am having the strangest feeling
that I have been here before. I called you a few months ago
and you told me you had no problems. Now you tell me that well
your problems are too numberous to mention, refuse to give me
a bug list - so I at least have a clue what you think you fixed
and tell me that any problems I am seeing are an illusion. So
the bottom line is this. I got no problems - and even if I did
you are not going to do anything about them. I can buy your
new stuff if I want it. But even then if I still have problems
you aren't going to do anything. That a fair summary?

Well I would not have said it like that.

So hey good luck with Soft.Logik. If you got a lot of money for upgrades -
a lot of patients - and want a DTP system to write *MEMOS* this is just
the package for you.

I use the same printer and it works just fine, contrary to a previous followup, I've never had to put it in IBM ProPrinter mode.

>I do a screen dump (Pressing Alt and Help) I get a line of
>the screen followed by a line feed, so on paper you get the
The only thing I can think of that would do this is having the pixels per line set wrong in the ST. To fix it (and/or check it) go to the controll panel desk accessory and click on "Install Printer", in the printer menu select 960 pixels/line. Now save the desktop (so you will always have the 960 setting) and then try a screen dump.

> ago. But remember, the ST is not a games machine.

He's right, you know. And Flight Simulator is not a game. And Social Security deductions are not taxes. And Operation Desert Shield is not a war.

Personally, I think DM is one of the best games ever written for any machine. The only thing that could have been done to improve it (and other games of the genre) would have been to put it on a LD and include more (EX-cel-lent!) animation.

From: drp9500@isc.rit.edu
Message-ID: <1990Oct25.182809.8256@isc.rit.edu>
Source record: 237718

I just got a file copy of TOS 2.0, has anyone done anything with or
can someone tell me some of the major changes they made?

In the dinky text file that accompanied it:

Icons can be dragged outside the windows
7 windows open at once
function keys and keyboard commands
variable icons
supports all 6 resolutions for the TT

anomg others....

Now these all sound neat but I don't know if it is worth a whole
point jump....

I heard that this TOS is supposed to ship in Dec with the TTs

Also it's just under 100,000 bytes, sounds small.

>is "allowed" to post a message telling everyone his car is for sale,
>but he is not "allowed" to post a message telling everyone his new
>product QuickProgramProver is available for sale.)

I have to disagree with that. If we were to follow that rule to the letter, then any discussion of ANY commercial product, whether software, or hardware could constitute being called advertizing. For example, when someone posts complete specs and prices for the TT or the new Macs, is that not really advertizing? Any time someone posts the name of a product and a price and an address, is that not adveritzing? What difference is there if I post my address and prices, or if someone else does it. If someone wants to know, I'll post it.

And the "product" I was "advertizing" was a free demo. I didn't waste a lot of bandwidth by posting a 150K uuencoded file to the net. Instead, I posted a short message saying that if anyone is interested, they can email me privately, and then later posted a 9K message because a lot of people requested it. more bandwidth has been wasted arguing about this than my original 2 postings! The whole point of the demo is to give people a free taste of what I sell without forcing them to spend a penny. I am even mailing the demo disks out at MY OWN EXPENSE, and an not using the net's bandwidth to email dozens of 150K uuencoded messages.

What can be discussed if we can't talk about commercial products? Remember that message I posted about two weeks ago where I bitched about how commercial products don't get discussed on Usenet. Well I see why. And it ridiculous. We have here a network for the free exchange of information all around the world, and you're telling me I can't post a message telling people about my product. I'm not posting daily or weekly "ads", just one announcement. If you're telling me I can't do that, then Jesus, what's Usenet for? There is just so much PD software we can talk about and distribute.

- Darek

>special settings I need to make, or is there another terminal
>program that works?

It's probably trying to read from the same device MGR reads from, or
something along those lines. (And failing.) I wrote a small dumb terminal
program that I use with MiNT/MGR, available on atari.archive in the
telecomm directory - tip.arc. (Modeled after Unix tip, but quite a bit
less of a program... }-)

The standalone zmodem programs seem to work OK, except the code to determine
the baud rate doesn't yield correct results when MiNT is running. This
usually results in the rz/sz program resetting the line to 19200 instead
of accepting the current speed. I recompiled the stuff with that speed
determination code #ifdef'd out to get it working...

2804. Spectre and joysticks

Newsgroup: comp.sys.atari.st
Date: 1990-10-26 00:11:27 UTC
From: carlitz@unix.cis.pitt.edu
Message-ID: <53288@unix.cis.pitt.edu>
Source record: 237724

Recent discussions have touched on the Spectre GCR. I have a Spectre 128 and regard it as an excellent accessory for the Atari. Recently I have encountered one odd little bug. I have K1 Ed-Lib from Drumware, which uses a little gadget plugged into the joystick port for copy protection. This gadget seems to drive the Spectre wild, making the mouse unusable. I'm using version 1.9 of the Spectre software while waiting for the new version 3.0. I have TOS 1.4 - if that matters for anything. Has anyone seen this problem before, and is there any solution short of unplugging the joystick gadget or putting it on a switch?

Bob Carlitz

>font program? Also, I can't seem to get Gulam to work with MGR. How
>do I get MGR to run the VT52.PRG before it executes Gulam?

The environment variables must be set *before* MGR is run. For example, if you're using the default init.prg that comes with MiNT, put commands like
setenv MGRFONT c:/mgr/font
setenv MGRICON c:/mgr/icon
in it. The MGR.RC has nothing to do with setting up these paths; rather, it allows you to customize the MGR environment. See the mgr.1 file in the docs/ directory.

As for Gulam -- try "vt52 gulam" while in the same directory as gulam. WARNING: make sure your gulam.g file turns off mouse handling; otherwise, gulam will steal the mouse vector from MGR and mess things up. Also, gulam isn't very nicely behaved in a multitasking environment, because it redefines the keyboard; if it's killed accidentally, the keyboard stays redefined, which makes for big problems when another program gets loaded into the memory gulam used to occupy (the keyboard map gets filled with random garbage).

> Also, I tried using BGACC with MiNT and it gives me two bombs

>Does anyone have any suggestions? Thanks very much!

Strange. Does the bomb happen after you select the program to run? If so, it's probably the program you picked. If not, try hitting CTRL-ALT-F1 twice after you've picked the program but before you click on "OK". You'll get a detailed report of what's going on inside of MiNT, which may help you to isolate the problem.

This is a file for the pirate program PRO-REBEL. It uses hacked copies of
PROCOPY running under a front end that enables one to save a disk to a file
with copy protection info (to allow modeming protected disks). I doubt very
seriously that the PROCOPY folks condon this program.

Great! Please post something on the net when you get the english version
ready. It is my understanding that most programs sense and use the extra
space automagically, and perhaps if the product gets popular (in the US),
folks with fix/patch the programs that don't. Thanks in advance.

The move function is new to the TOS 1.4 desktop only. Under an older TOS a program could do this with the Frename() system call.

The STE has another chip-set; the DE-signal (which is modified by overscan) is only inside the shifter :-(.

We are planning to sell the hardware in USA, we already sold it in australia. (With german manuals, since the english version is not ready yet).

>not really advertizing? Any time someone posts the name of a product and
>a price and an address, is that not adveritzing? What difference is there
>if I post my address and prices, or if someone else does it. If someone
>wants to know, I'll post it.

The difference? It's a question of ethics. I don't see any problem if
a person buys your program, becomes very happy with it, and then raves
about it on the net. That is what Usenet is for, the exchange of ideas.
It is completely different for you, the author, to blow your own horn,
tell us how overpriced other products are that compete with your product,
and then offer a promotion of your product (the free disk offer).

>And the "product" I was "advertizing" was a free demo. I didn't waste a lot
>of bandwidth by posting a 150K uuencoded file to the net. Instead, I posted
>a short message saying that if anyone is interested, they can email me
>privately, and then later posted a 9K message because a lot of people
>requested it.

Well, that was very GENEROUS of you to only make all the sites on Usenet
propogate thousands of 9K files instead of 150K. It isn't the length that
is wrong, it is the concept of what you're doing that is wrong.

>more bandwidth has been wasted arguing about this than my
>original 2 postings!

This is true. However, that doesn't absolve you of what you did. What you
did was still wrong.

>What can be discussed if we can't talk about commercial products? Remember
>that message I posted about two weeks ago where I bitched about how commercial
>products don't get discussed on Usenet. Well I see why. And it ridiculous.
>We have here a network for the free exchange of information all around the
>world, and you're telling me I can't post a message telling people about my
>product. I'm not posting daily or weekly "ads", just one announcement. If
>you're telling me I can't do that, then Jesus, what's Usenet for? There is
>just so much PD software we can talk about and distribute.

Who said we cannot discuss commercial products? I see them discussed all
the time? There is a difference between discussion commercial products and
a software author plugging his wares on the net.

2814. GCR & overscan

Newsgroup: comp.sys.atari.st
Date: 1990-10-26 15:59:56 UTC
From: billm@CSUFresno.EDU
Message-ID: <1990Oct26.155956.3064@CSUFresno.EDU>
Source record: 237734

I have a few questions about Spectre GCR and Overscan that I hope
someone can answer for me.
First, where can I get info about overscan. I have gotten the software,
but not the article describing the hardware mods. Does the mod need to
be on a Mega, or any ST (I have a 1 meg 520 ST)? As I also understand
it is only available for the monochrome monitor, is this true?

About Spectre GCR. Will Spectre GCR work with the overscan on a mono
monitor? I have heard that some early Mac 128K ROMS were eproms, and
that the GCR doesn't allow eproms to prevent piracy is any of this true
(ie. will I need to be careful if purchasing used roms mail order)? And
finally, where can I get bot the Spectre GCR and Mac roms, and what
prices should I expect?

Thank you for your help, please respond vie email.

>
>I need to trap all FSFIRST/FSNEXT calls (in order to substitute my own
>filenames), as well as FOPEN() calls ...
>... So far I have this working perfectly EXCEPT for the fact that
>I can't find the current DTA address; is there any way that I can
>do this while processing a TRAP #1?

You don't have to do it while processing trap #1. Just find out where
it starts, and when it changes. ie: during the initialization of YOUR
code (which shouldn't be in a trap #1), do a (normal) Fgetdta() call.
This gives you the DTA address at the beginning. Now just trap Fsetdta()
(along with Fopen etc. that you're already doing) in case this PD
program changes the DTA.

It seems to me this should be sufficient, but my ST is not at hand, so
I can't check.

Newsgroup: comp.sys.atari.st
Date: 1990-10-26 17:48:48 UTC
From: erlingh@idt.unit.no
Message-ID: <1990Oct26.174848.9737@idt.unit.no>
Source record: 237736

I'm also interested in this info.

I'm wondering wether I could just buy the Syquest mechanism and
plug it into the Adaptec controller in my megafile.

If you want to add a second drive, were do you connect it ?
1) to the port j1 (besides j0 where the original drive is connected) ?
2) And the datalines, can they just be extended via a cross-cable ?

The adaptec is an RLL controller, is the syquest RLL or SCSI ?

Pugh,, lotsa questions, but I would really like to hear from anyone that
has done this to his(/her ?) megafile.

"Correctly?" I can recall no TOS documents that forbid closing handle 0.
Since TOS does permit it, I would conclude that closing stdout should
cause no error. Note that Unix works the same way.

2824. gcc ?????

Newsgroup: comp.sys.atari.st
Date: 1990-10-27 16:39:22 UTC
From: eao@point.mps.ohio-state.edu
Message-ID: <1990Oct27.163922.3208@zaphod.mps.ohio-state.edu>
Source record: 237744

I just pulled gcc over from atari.archive (in particular gccbin and
g++-gnulib) and got it up and running on my Mega-2 running gulam. However
I must be doing something wrong. The trivial K&R program hello.c
(i.e., printf("hello, world\n")) works fine but if I add the line
fprintf(stdout, "hello, world\n") it aborts when loading with:
hello.o: Undefined symbol _stdout referenced from text
Something very funny is going on because printf calls
_printf_guts with fputc(c,stdout) being one of its arguments - and this
works fine. I tried recompiling fprintf and replacing it in gnu.olb .
This leads to another problem because if I do ar rv gnu.olb fprintf.o
then it creates the new library gnu.ol$ (presumably to mv to gnu.olb
when it is done) and aborts when it closes this file. I then added
a printf statement in the file fprintf.c, recompiled it, and added it
to gnu.olb using ar rv (so I had to exit gulam to rename gnu.ol$ to gnu.olb).
Then when I tried compiling hello.c I had lots of error messages since
ld didn't know what to do with _printf . Somehow when I am compiling the
include files are not being handled correctly. However the #include command
is working because when I comment it out I get a compilation error that
stdout is undefined (so I think my GNULIB and GNUINC are correct).
Please - what am I doing wrong? Thanks, Ed Overman

I know of at least one company that will be making a sound digitizer for older Macs that will plug into the serial port to get the digitizing capabilities of the newer Mac models. Should work, since the ST's serial port is compatible with the Macs (all you need to do is make/buy an adapter cable for the Mac's stupid proprietary serial port connector.) The company is "Articulate Systems, Inc." and the product name is _DesktopMikeVL_. I got this from MacWeek of 10.16.90.

Source record: 237748

In article <58521@microsoft.UUCP> darekm@microsoft.UUCP (Darek MIHOCKA) writes:

>I have to disagree with that. If we were to follow that rule to the letter,
>then any discussion of ANY commercial product, whether software, or
>hardware could constitute being called advertizing.

Usenet is a diverse place. Here's what news.announce.newusers has to
say about commercial postings:

| Announcement of professional products or services on Usenet is allowed;
| however, since someone else is paying the phone bills for this, it is
| important that it be of overall benefit to Usenet. Post to the
| appropriate newsgroup -- comp.newprod -- never to a general purpose
| newsgroup such as "misc.misc". Clearly mark your article as a product
| announcement in the subject. Never repeat these -- one article per
| product at the most; preferably group everything into one article.
| Advertising hype is especially frowned upon -- stick to technical
| facts. Obnoxious or inappropriate announcements or articles violating
| this policy will generally be rejected. This policy is, of course,
| subject to change if it becomes a problem.

This "rule" is really just custom; each network within the Internet
has its own formal rules. Occasionally I find myself agonizing about
press releases that I find within Z*Net, because they go over the
customary line.

|And the "product" I was "advertizing" was a free demo.

One short message seems appropriate to me. But I'm not an authority on
anything.

2827. DVI previewer for color monitor sought

Newsgroup: comp.sys.atari.st
Date: 1990-10-28 02:05:32 UTC
From: <>
Message-ID: <1990Oct28.020532.22888@cs.utk.edu>
Source record: 237749

Could anybody suggest a solid previewer for the DVI files ?
I looked at dvist, dviatari, showdvi, and probably couple more I forgot
about. But they were all made for monochrome monitors, and alas, I
have a color monitor. None of them seem to be able to cope reasonably
with color monitors.
If anybody knows about a previewer that does work well, please let me know.
If there is no such thing, I am willing to work on some existing program
and incorporate the color monitor support. Therefore, pointing me to source
code would be appreciated, too.
Many thanks,

Andrew Krzywdzinski

This seems rather crazy to me. He would have to right his
own software to make use of the sampler. There are several ST specific
Audio digitizers available and even a few kits, such has the one that
was published in STart magazine a month or two ago. Why bother with
a Mac digitizer when there are so many ST versions available? Unless
you want to use it under Spectre..? (Can you?)
I own the ST Replay system by Microdeal. It samples up to 50khz
and the software included allows simple sound editing capabilities, such
as cut and past. There is a new version called Replay Professional
which includes an updated editor and is a higher quality sampler then the
orignal replay cartidge. There is also a music program called Quartet
that will play back four samples at once and pitch shift the samples
to different frequencies to play music. You can down load a song
demo of Quartet from the atari.archive. There are also many sample
files there and a few sample play back programs, some of which will
replace the bell sound of the computer, key click of different keys,
and errors beeps with different sound samples. If you have replay, you
could record your voice and use it as an error beep, for example, when
the alert box appears and tells you that it can't read Drive A because
there is no disk there, you could have the computer say in your own voice

"Put a disk into drive A" or whatever you want. It is also fairly simple
to playback the samples in your own programs.
I hope this helps. Take care!

Sincerely,

Michael Rose

Try version 1.0 of showdvi. It should run on color screens, too.
This previewer is available via anonymous ftp from
atari.archive.umich.edu (/atari/tex: showdvi-1.0.zoo),
unido.informatik.uni-dortmund.de (/pub/comp/atari-st/StTeX: showdvi-1.0b.zoo),
forwiss.uni-passau.de (/archive/atari/tex: showdvi-1.0b.zoo).

dviatari certainly does work on color monitors; I wrote it because I was having the same problem as you (I only have a color monitor). Try it again, and make sure the environment variables are set up correctly.

Sounds like you've got a library/include file mismatch. There are two
"families" of libraries for the gcc: the original library by John Dunning,
that came with gcc 1.23, and derivatives (including, I think, the one that
comes with g++); and the gcc 1.37 library that Jwahar Bammi and I put together,
and derivatives (including one by Edgar Roeder, and the MiNT library). The
former has _printf_guts and stdout; the latter has _doprnt and _iob[].
My suspicion is that you're using header files for the first library with
a gnu.olb that's set up for the second library.

Since most Atari people have reportedly finished DM and CSB, perhaps someone can tell me about the "Untranslatable Scroll" in CSB - it looks like gibberish, but it must have some purpose. Did anyone ever figure out either how to translate this scroll, or what it was used for? (I'm not talking about the scroll that showed the location of secret buttons in the Dain area). Also, the blue field in the Demon Director area that says something about trading items, but it simply takes whatever you place there and gives nothing back?

Today I received an email of 50K despite the plea in my .sig that no mail be sent to me from outside Germany. The contents ? A short notice by Darek Mihoka (sp ?) saying that I probably haden't even tried his software, so to help me along, he included the first part of his piece of coding in the message. Now, this in itself is an insult (I know Quick ST and I know why I use Turbo ST), but what makes me really *ANGRY* is this: I HAVE TO PAY FOR EVERY KB OF EMAIL I RECEIVE !!! That is the reason for the relevant line in my .sig (emails inside Germany is free) and thus Dareks misbehavior COST ME $12 !!!

Miserable salesmanship and a dirty way of dealing with potential customers, if you ask me.

Infuriated,

Techno

>thing when there are so many ST ones available?]

That is true unless he is going to use the SpectreGCR. In that case, if it works, then it's definitely a better product than the very cool-groovy Replay 4. Why? Well, Mac software will soon support sound embedded into data: data bases, word processors, hypercard/hypertext, mail, and so forth. In addition, as you say, if he can write his own program (and get info on the hardware) then he might be able to use it in ST mode.

But what about quality? Well, you can have the best fishing pole on earth but if you can fish only at the local pond, what's the point. I'll bet that the Mac device will not be that great performance wise, but so what. The ability to use your data in many ways is worth a lot.

I got a copy of GEMINI 1.1 from atari.archive and was most impressed with it.
It is quite like NEODESK but has a good shell...

Sadly, all the DOC's and info are in GERMAN!, my German is limited to about
100 words.. So, is there any information out there in net land in ENGLISH
for this handsome looking suite -- Where is it, lemeatit!

Also, if any kind soul has fought their way in..

What is the difference between GEMINI and VENUS as they look the sameish to me.
The Make supplied with SOZOBON bombs when run from it - any idea's.

Thanks!
..Clive

GEMINIUK is the English version. It's around here somewhere. I'm
surprised it's not at atari.archive. Look in the binaries section.
I don't know where I got my copy, but I have it. I can post it if
you want, but I'd be surprised if it wasn't there already.

2840. Teac DS/DD in my 520STfm??

Newsgroup: comp.sys.atari.st
Date: 1990-10-29 04:14:59 UTC
From: eahsnsr@nmt.edu
Message-ID: <1990Oct29.041459.11480@nmt.edu>
Source record: 237627

Is it possible (and easy) to just install a Teac DS drive in my 520STfm? I realize that I'll have to do some work on the case to get it to fit, but since the drives are fairly cheap, I thought it might be a cheap upgrade so I can get rid of my SS drive. If it'll work with little modification, could anyone give me specific model numbers to try. If a Teac won't work, then could someone tell me what would work...cheaply. (I've got poor college student syndrome -- std. 520stfm w/mono monitor!)

Also, I saw in a UK mag that there is an easy SIMM memory upgrade for ST's. It's made Evesham Micros. Does anyone know if there is a US distributor for it? Prices? Reviews? Comments?

Thanks.

In addition to TOS 1.4, and DCOPY, Hypercopy from Germany is very impressive.
On 1 meg memory or better, there's no disk swap. 800K without format is about
30 seconds or less, with format, always less than a minute, still often less
than 45 seconds.

2844. New stuff on atari.archive

Newsgroup: comp.sys.atari.st
Date: 1990-10-29 06:09:39 UTC
From: hyc@math.lsa.umich.edu
Message-ID: <1990Oct29.060939.5082@math.lsa.umich.edu>
Source record: 237605

Excerpt from a message from Michael Ritzert...

%From: Ritzert%DMZRZU71.BITNET@CUNYVM.CUNY.EDU
%Subject: Re^2: blitter problems

%>> P.S.: Some weeks ago, i tried to email You some software i have ported
%>> to the st (sc61, tr2tex, gnuplot2.0, beebe based tex drivers for
%>> overscan and desk jet). Did anything arrive at Your site?

I have just received these files and put them into the new directory on
atari.archive.umich.edu. I'll be moving them to more appropriate locations
after posting this message... Michael sent the following files:

gnu881.zoo pml-compatible 68881 library for gcc
dvidrv-s.zoo source code for DVI drivers mentioned above
dvidrv-x.zoo DVI driver executables
gnuplt_s.zoo source for GNU Plot 2.0
gnuplt_x.zoo executables
sc61_s.zoo source for the PD spreadsheet, v6.1
sc61_x.zoo executables for SC
t2t_s.zoo source for troff-2-tex converter
t2t_x.zoo executables for troff-2-tex

%Tomorrow I'll start working on sc6.8. Lotus compatible.

Looking forward to seeing this...

%There's also a unix version of the DeskJet driver. It has been
%implemented on an 88/open system (Tek xd88/10). It does only support the
%compression mode 2 output routines and still uses the original font
%searching and replacing algorithm (the tos version has one which is
%better but still has to be improved). I simply don't know how to read a
%directory in a manner portable between bsd, sys V.3, and minix and
%Eric's tos lib (that's where i have to develop the code) exept
%using something like system("ls > tempfile") (wouldn't work with gulam
%due to its sorting) and analysing this.

I haven't examined the contents of the archives, other than to verify that
they arrived intact. I imagine you can get more info about these from
Michael. Also, he apparently doesn't have Usenet access, but reads the
Info-Atari16 mailing list. Does anyone know the current distribution point
for this list? He mentioned that he has been unable to post to that list.

> I need multiple files open and these files get to 30+ pages each.
> Now *everything* panics. You got it. Your working along cutting
> and pasting - and the next thing you know three bombs.

(1) Do you have enough memory to keep multiple 30-page documents open, plus the spelling checker, fonts, etc.?

(2) Are you using the right tool? PageStream is not a text editor. Don't use a chisel to drive screws.

I've been using PageStream to lay out newsletters for a couple of months. I've crashed it. But then, I've also crashed Aldus Pagemaker and locked up Microsoft Windows. Come to think of it, I've blown up something on every computer system I've used, so I'm not in a hurry to condemn Soft Logik as a bunch of incompetent geeks.

Bugs are a fact of life. The question is whether the bugs are sufficiently serious and widespread as to render the product useless. That has not been true in my experience.

I write and edit with a text editor (MicroEMACS). (If I used a spelling checker, I'd run it while editing, not while formatting.)

I filter the MicroEMACS text into a format compatible with PageStream, plan the document layout, and then begin importing and placing the page elements. When I'm done, I write out PostScript files. That much of the program appears to work reliably.

I have some disagreements with Soft Logik's user interface and the inability of PageStream to accept embedded markup commands, but those are design questions and not bugs.

Since I don't use the spelling checker or color separation facilities, I don't encounter any bugs that may be lurking there. Keep in mind that those are fairly recent additions to the program. If there are bugs, that's where they're likely to be.

2849. PC-Ditto

Newsgroup: comp.sys.atari.st
Date: 1990-10-29 11:18:54 UTC
From: isodonovan@npe.isnet.inmos.co.uk
Message-ID: <118.272c101f@npe.isnet.inmos.co.uk>
Source record: 237611

This may well be a silly question based on false assumptions, but here goes...

A friend of mine has recently bought the PC-Ditto software. He had some trouble obtaining it and has since been led to believe that the producers have gone bust.

My questions are:

(1) Is it true?

(2) If so, what does this mean for anyone else wanting to buy PC-Ditto - if there is no one to buy it from does the software slide into the Public Domain? - or does it simply cease to be available? - or ??

And sort-of related:

(3) Is there a PD PC emulator? (PD-Ditto???)

If it makes any difference, we're in the UK.

Thanks to anyone who can shed any light.

Gee. I noticed that after Chris's profound comment on Atari stock ("Draw your own conclusions") Atari stock must have gone up by a point! It closed down at well over 2 - if memory serves it was 2 3/8 (Chris mentioned, I believe 1 3/4?)

That means an increase of nearly 40% in one week! Draw your own conclusions.

Proper conclusions should be that the stock market is fairly volatile at the moment, that we are in a 'recession', that computer stocks aren't anywhere near as interesting as oil futures, and that, since noone here is a bonded stock market analyst/broker, we really haven't the faintest idea what is REALLY happening. I -could- be wrong about this last point -- Chris, if you're a stock market analyst/broker let us know...

While someone's at it, is there an FTP site that "houses" the "COSH"
sequencer? (The 16 track one from England) I saw a review on it
and it's supposed to be pretty good. I don't remember if it's
freeware or shareware... Anyone?

Source record: 237629

Does anyone have the file 'stmouse.s' mentioned in the MicroEmacs 3.10 file st520.c. It doesn't appear with the sources I have.

Also can anyone shed some light on the rumoured Midi-tasking whatever? What with MiNT and RTX etc it would be nice to know what Atari plan in this area. Will Midi-tasking will be any more general purpose than the name implies. What exactly will it be capable of? Will it require programs to be re-written to make use of it?

John M Williams jmw@tasis.eecs.utas.edu.au

2854. Re: Help with floppy drive

Source record: 237640

Well, I have some new info on my floppy drive problem, which
may pinpoint the problem (at least for people who know what is
going on)...First of all, I took apart my one of my drives to
watch if the head moved...it didn't seem to. When I click on
the drive icon, it looks like the head starts to move, but
then stops very quickly. I tried formatting a disk using
DCFormat...the head moves across the disk and seems to format
it. Later, when trying to access the drive, the same old thing
happens, i.e. it looks like the head is starting to move, but
then it stops and nothing happens. I tried to copy disks
using DCFormat...it gives an error message indicating it
cannot read the disk. I also tried using DiskToolBox to do
something to a disk in the drive, but once again, I get an
error message implying that it cannot read the disk.
Does all this seem to imply that the controller has gone bad?
IF so, how hard is it to replace one?
Once again, thanks for any input...I'd like to get this
straightened out asap.

Source record: 237614

I'm thinking about adding some graphics to a program that so
far has been fully text based and running as a TTP file. I know
that I can do this on the low level, but I was wondering if it
is possible to call GEM functions from a program that was already
launched as a TTP program? Sounds unlikely, but I haven't found
a specific discussion of the problem in my reference books.

Cheers! -- Jim O.

> Since TOS does permit it, I would conclude that closing stdout should
> cause no error. Note that Unix works the same way.

Wether RTX correctly generates an error or not, the problem is still
in the freopen() function. The ANSI standard says that a failed close
on the old file should be "silently ignored". So if freopen would
conform to the ANSI standard, neither RTX nor TOS/MiNT should cause
any problems.

BTW: The gcc library and executables on cs.uni-sb.de should have no
problems with RTX (at least not this one caused by freopen), since the
used freopen implementation conforms to ANSI-C.

No, it just means that someone who works for Atari bought or sold some of his/her shares. This is perfectly legal. What Bob is getting at is that if the insiders are selling, it indicates a lack of confidence in the company coming from people who WORK for the company. Many investor services follow insider transactions for companies to keep tabs on employees' expectations of future performance.

2859. Enq/Ack Terminal WANTED

Newsgroup: comp.sys.atari.st
Date: 1990-10-29 15:56:58 UTC
From: rrd@hpfcso.HP.COM
Message-ID: <7340017@hpfcso.HP.COM>
Source record: 237615

Hello all,

I'm getting a remote access account at work. Unfortunately, the RA server requires Enq/Ack handshaking, and the emulator(s) I have available don't support Enq/Ack.

Enq/Ack handshaking is used mainly with HP3000 computers and associated terminals. I haven't seen it in the menu for either Atari's default RS232 setup, their VT52 emulator, or Simon Poole's Uniterm 1.8. I don't have Flash, so I don't know if it has Enq/Ack.

Does anyone know of a terminal emulator for the ST that includes Enq/Ack handshaking? Even a (shhh!) commercial one?

Any help you can give would be greatly appreciated. Respond here or via email.

I am selling some ST software. This software comes with the origional box, disks, and books. If you are interested, please leave me e-mail or call me at (317)743-5122.

Thanks

Drew Whitehead

Here is a list of my software for sale.

New Games:

Annals of Rome $10
Murder on the Atlantic $10
A Mind Forever Voyaging(Infocom) $10
Double Dragon $10
Micro League Baseball $10
Gridiorn $10
Hardball $10
Into the Eagles Nest $10
Mean 18 Golf $10
Seconds Out $10
Mercenary Second City Disk $5

Used Games:

Timeblase $5
Stock Market Game $5
Orion's Run $5
Hex $5
Lords of Conquest $
Hacker $5
Hacker II $5
Skyfox $5
Into the Eagles Nest $5
Sundog $5
Championship Wrestling $5
Major Motion $5
Time Bandit $5
Formula One Grand Prix $5
Harrier Combat Simulator $5
Alien Fries $5
Twilights Randsom $5
The Sentry $5

Star Fleet I $10
Space Quest I $10

Space Quest II $10
Kings Quest II $10
Ultima II $10
Ultima III $10

Leaderboard Tournament Disk #1 $5
Rockford $5
LCS Wanderer $5
Shoot the Moon $5
Knight Orc $5
Santa Paravia and Fiumaccio $5
Fahrenheit 451 $5
Warship $10
Flight Simulator II $10
Starlight Games Creator $10
Spiderman $5
Human Torch and the Thing $5
Pirates of the Barbary Coast $5

Other Software

New:

Quantum Paint $15
Spectre 128(no roms) $100
Magic Sac + (no roms) $50
Holmes & Duckworth Base $15
Habawriter $10
Habadex Phone Book $10
Philon Fast Basic-M Compiler $15
Max Pack $10
Print Master Art Gallery $5
Partner ST $15

Used:

Chat $5
Zoomracks Dbase $15
Ageis Animator ST $15
Dollars and Sense $10
Thunder Writers Assistant $10
Habba Check Minder $10

Chris,

> There is a difference between discussion [of] commercial products and
> a software author plugging his wares on the net.

Not much.

When you grow up and graduate and your employer sends you to Conferences, Symposia and Trade Shows, you will have to learn for yourself to tell the difference between a "technical presentation" and a "sales job". Right now, you can go down to the engineering library and check out a back issue of [insert journal name here] to get some practice. Half of the articles are "technical articles" and the other half are "sales jobs," and you can't tell the difference by the title or the color of the page.

We in the industry don't particularly mind listening to or reading a "sales job." There's some cool stuff out there, and how else are we going to find out about it? If you want to sell a product, you're going to need to advertise. "Technical presentations" and "technical papers" are a good way to do it. And you don't have to pay for the space! We just learn to recognize the sales job up front, and then wear our BS-blockers for the remainder of the article or presentation.

While you're in the trade journals, read the "Tech Notes" or "New Developments" section. There are some reviews of new products in there, that aren't really reviews. They are press releases, written by the manufacturer or a hired pen, artfully crafted to sound like a review. Some of them don't even mention the manufacturer's name, or they use the hired pen's name to make the review sound legitimate. The journals print them verbatim. They don't review the products to check the text's accuracy.

Whether Darek crows about his product or whether someone else does, it doesn't make any difference. For all you know, Darek gave what's-his-name a free copy of QSTII and asked him to comment on it on the net. (Not saying that he did, mind you...) That's not illegal or unethical. That's business. You may not like the way it looks, from your side of the fence, but I'd be willing to bet my ST that within 10 years you'll see it differently.

No flames intended in any of the above. Please don't go looking for any.

> . I'm using version 1.9 of the Spectre software while
> waiting for the new version 3.0. ...

> Bob Carlitz

Hi Bob,

All registered users should have received version 2.65. Did you send in your reg card? Does GBSmall know where to get hold of you? Have you told them about the problem? Dave & cohorts are still spending a lot of time patching up Mac programs so they work according to Hoyle.

Oh yeah, just for fun, write or call the company that makes [I forget what it's called; I deleted that part of your posting] and tell them it freaks out the mouse on your Mac. Don't let on that you're using a Spectre. They may have already gotten bug reports from other Mac users, and have a fix available.

Good luck.
Ray

You are missing the line #include <stdio.h> -- this header file is required when using the standard IO functions and it defines symbols like stdout. Technically, it's even required when you use printf, but your program happens to compile because GCC happens to do the right thing without the printf declaration.

This is not an accident: GCC was designed in part to be forgiving to C programmers who don't do things they technically should do. I have used an ANSI compiler which did NOT forgive using printf without including stdio.h!

2869. cross-compiling

Newsgroup: comp.sys.atari.st
Date: 1990-10-29 23:59:21 UTC
From: hyc@math.lsa.umich.edu
Message-ID: <1990Oct29.235921.23294@math.lsa.umich.edu>
Source record: 237625

Just a little FYI: I discovered today (sigh) that the C compiler on
Sun Sparcstations always tries to align structure elements on longword
boundaries. Thus my "unix-compatible" (hah) TOS disassembler fails to
work, because there are extra pad bytes inserted to my structure declarations.
(e.g.,
```
struct GEMHEADER {
short GEM_MAGIC;
long GEM_SEGS[GEM_NSEGS];
long reserved;
long unused;
short GEM_FLAG;
}
```
This defines the start of a TOS executable file. The structure, as defined,
is 28 bytes on an ST, and 32 bytes on a Sparc. Bleah.)

If you're trying to write portable code, don't assume you can read or write
structures in a single operation. If you're already using buffered I/O then
it's really not much more overhead to read X bytes at a time and fill structures
in explicitly, one element at a time...

Of course, if you're only writing for 680x0 architectures, this won't ever
be a problem (?) since data is aligned on word boundaries (2 bytes, 16 bits)
and not longword boundaries (4 bytes, 32 bits). [but watch out for those
single-byte declarations! }-)]

I'm having trouble locating zoo.ttp and so can't unscramble a lot of stuff. Can anybody mail me one direct? or send me some foolproof addresses for a couple of servers where I can find one? Thanks.

2872. MiNT 0.7 -- what features would you like to see?

Newsgroup: comp.sys.atari.st
Date: 1990-10-30 03:24:24 UTC
From: ersmith@uwovax.uwo.ca
Message-ID: <7547.272cba29@uwovax.uwo.ca>
Source record: 237635

I'm in the process of fixing bugs in MiNT 0.6, and adding new features.
If you've got bug reports, or suggestions for new features, please send them
along to me. (This release is primarily intended to be a bug fix release, with
few major changes in functionality, so I don't expect major new features like
swapping to be implemented.) Things that are likely to be added are
changes to enhance the functionality of existing features, and new features
that are easy to implement and that will make future upgrades easier.
Note also that I'm mainly interested in kernel level changes here; the
user level programs (like init.prg) I'll mostly leave for others to improve.

Among the things already implemented for MiNT 0.7 are:

(1) TT support (courtesy of Allan Pratt)
(2) CTRL-ALT-Z, CTRL-ALT-C, and CTRL-ALT-\ force SIGTSTP, SIGINT, and SIGQUIT
even if the terminal is in raw mode
(3) the v:\mouse driver is now compatible with the ALT-cursor key combinations
(4) MiNT domain programs get file names in mixed upper/lower case from
fsfirst/fsnext calls (if the file system supports it, of course). Ordinary
TOS filenames are automatically converted to lower case; process and FIFO
names can now be mixed case.
(TOS domain programs (i.e. non-MiNT aware ones) still get names all in
upper case)
(5) new system calls: Sysconf (returns information about the current version
of MiNT), Dpathconf (returns information about file systems), and
Psigpending (returns the set of signals that have been sent but not
delivered).

Known bugs that are fixed:

(1) Malloc(-1L) was returning the wrong value (actually 2 different bugs)
(2) killpg() was not checking to see if the current process was being sent
a signal
(3) the cookie jar was set up incorrectly (not many programs broke, but I
might as well get it right this time :-).
(4) the already existing environment was not being passed by MiNT to
the first program it ran (init.prg)

2873. SCSI Device ID#

Newsgroup: comp.sys.atari.st
Date: 1990-10-30 05:45:49 UTC
From: paulm@ccicpg.UUCP
Message-ID: <786@ccicpg.UUCP>
Source record: 237641
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am currently writing a driver for my scsi cartridge tape drive.
I have it working doing tar's and other stuff as Device ID# 0 but
I want it to work with my hard disk pluged in also. I have written
a lot of disk code in assembler based on some code from an Abacas
book but I can't get it to talk to anything but ID 0. Is the BMS100
capable of talking to other IDs (preferably #6) ?

If and when I get this working I'll release my code here as PD.
Any help would be apreciated.

Here is a little code segment:

```
scsi_read:
movea.l #$ffff8604,a0 ; WDC
st $043e ; flock
[....] ; move the buffer address in 3 DMA addrs
move.w #$88,2(a0) ;

lea CDB,a2 ; get CDB pointer
clr.l d0 ;
move.w #5,d1 ; CDB size

10$: move.b (a2)+,d0 ; get CDB byte
swap d0 ; put it in upper 16 bits
move.w #$8a,d0 ; get ?
move.l d0,(a0) ; write it to WDC
brs short_wait ; short wait for intr
dbf d1,10$ ; loop for 6 CDB bytes

......
```

The code was from memory so probably is not very correct but hopefully
it will give you some idea on where I need to work on this for the ID.

Well, Thanx in advance, Paul Moreau.

2875. DC Software (DCDesktop)

Newsgroup: comp.sys.atari.st
Date: 1990-10-30 14:19:07 UTC
From: jgw88@ecs.soton.ac.uk
Message-ID: <789@ecs.soton.ac.uk>
Source record: 237644

Why doesn't DC Show work on my hard disk. (This includes DCShowpic, DCShowArc)
If called by pressing the function keys, they all work OK, but if I double click on for example, a text file, an arc file, or a picture file then it zooms the icon out then just sits there, no text display , and locks up the desktop.

I have installed them according to the manual, and use DCConfig etc. My set up is as follows: 1040 STF with 45MByte TCT hard disk drive. The harddisk drive uses the ICD drivers. I had no other TSR running at the time.

Please help me, as DCDesktop is a great product, and if I'm doing something stpuid I'd like to know.

Thanks in advance,

I would agree with you if Darek was paying for this space. Unlike a trade
journal, where one pays to advertise, this medium is paid for by its
users. As such, I don't think it is ethical for a business to blow their
own horn and make promotional advertisements.

I don't think I'll see this differently in 10 years. It isn't WHAT he is
doing that is bothersome, it is the fact that others are footing the bill
to pay his advertising costs. If he is making money for this "product"
then he should have to pay his own advertising costs.

I have one that runs under the Mark Williams MSH or as a .ttp file.
I wrote it when I lived with a single floppy. It reads all the files
into memory then asks you to change the disk. It's written in C. You
can have source and/or binary. Does anyone want it?

(It is possible to live on a single double sided drive with Mark Williams
C 1.0.)

2881. Gnu C++ setup?

Newsgroup: comp.sys.atari.st
Date: 1990-10-30 22:30:00 UTC
From: mts10271@uxa.cso.uiuc.edu
Message-ID: <46300105@uxa.cso.uiuc.edu>
Source record: 237649

Can somebody please explain how to get the Gnu C++ program working.
I have ftp'ed the execs (C++) and the three library files and unzoo'ed them.
I set the paths to fit my configuration. I downloaded Gnu CC and
set that up. I now have 2! gnu_cpp.ttp files- with different lengths.
I finally downloaded Gas and set that up. Now, when I try cc test.c
or cc test.cc, I think the cc program is running the corresponding
preprocessor and compiler, but I always get an exit code of -1 (in Gulam).
I have tried changing names, compiling by hand, etc. and have had no luck.
My test program just includes <stdio.h> and does a printf("Hello\n");
inside of main. I am really eager to get C++ running since I have a class
using the language (well, AT&T compiler..). Help!
Thanks in advance,
Michael Stepniczka

2883. Is there an inexpensive META.SYS?

Newsgroup: comp.sys.atari.st
Date: 1990-10-30 23:36:02 UTC
From: chu@acsu.buffalo.edu
Message-ID: <43447@eerie.acsu.Buffalo.EDU>
Source record: 237651

Is there a public domain, freeware or shareware META.SYS out there somewhere?

The last I checked, there is a program at comp.binaries that converts metafiles to postscript files. Anyway, if there is a legally available META.SYS out there, I was hoping to graph with Opus, convert the resulting metafile to a ps file, take that to the school laser printer and get my lab graphs done that way rather than by hand.

Buying a commerical package that includes GDOS (I already have G+plus anyway) and associated *.SYS files is more than my budget can bear. So if there is a free (in the legal sense, not necessarily monetary) META.SYS out there I'd appreciate it if someone told me its whereabouts.

Please respond via E-mail as this would seem to be of limited interest.

If you wish to flame me alleging that I am cheap or that I am expecting something for nothing, do that via E-mail also, please. :-)

HI

I have a request from an acquaintance in the Soviet Union. He has
an Atari 1040 ST and needs a book on Programming the Atari 1040ST.

I looked around the stores in Northern Jersey and have not
found a store that carries the Atari. I am sure that there must be
some. So, can anyone recommend a book for programming the
Atari and can anyone tell me of a chain store that carries
Atari Software and books. If there is one in NJ, it would be
even better.

Thanks to all and email will be appreciated since I don't
really read this newsgroup.

Source record: 237654

There are a couple reasons why I would not buy a NeXT. First is that
it really is not a computer that I would enjoy using at home. I work
with UNIX all day and the last thing I want to do when I get home is to
see the same thing. There are also serious games for the ST and the Amiga
that just will never happen on the next. I know that some people will scoff
at this, but blowing away 50 buzillion aliens is a good way to blow off steam.
I tend to see the NeXT as more of a work computer than a fun computer. If I
want to do some serious number crunching, I'll do it at work. If I want to
have some fun, I want that option. Plus, UNIX can be a real headache. Just
get a corrupted / partition and you know what I mean.

This sounds like it should work. Did you ever think that MTOOLS might be
the problem? I can't get it to work on our machines here at work. To
test it out just download an ascii on to disk and look at it. (also,
note that ST uses cr/lf as end of line whereas the SPARC/UNIX system
will be using just plain lf)

On my machine, the SPARC-written floppy's directory looks fine but the
first few bytes are just repeated over & over and the drive makes a
terrifying "chewing" noise (anybody remember the old Atari 810? :^)
Maybe the mtools programs don't handle the FATs right or something.

Hi,

I've recently acquired a somewhat less-than-healthy CZ-101 and am looking for some things:

1. Schematics!!! Particularly of the power section.

2. PD/shareware patch editor/librarian for an Atari ST computer. I have a simple one called CZPATCH; it has a random patch generator and stores patches, but can only transfer patches one by one (i.e. no bank dumps) and has a poor user interface.

I also am still looking for a PD/shareware *editor* for the Ensoniq ESQ-1. Please E-mail directly if you can assist me. Thanks!!!

>
> Rick Simonian

It's a real pain, isn't it, the way GDOS has, and has not, been released. I think there was a Meta.sys driver with Microsoft Write, which Atari UK bundled with various machines for a while, but just because they gave the package away free doesn't mean we can distribute parts of it for use elsewhere, does it?

I fail to see what interest Atari can have in stopping people from, say, saving an Opus chart as a .GEM file and importing it into a desktop publishing program. I suspect their answer will be that Doug Harrison should have paid them a big fee to distribute GDOS with the program. As it's a shareware program, and as he was only charging $15 for it, it clearly wasn't worth his while to do so. Maybe there's an opportunity for the CodeHeads to distribute a few fonts and a Meta.sys file with G+Plus? Simplest of all (well, maybe not, but then I'm no lawyer) would be if Atari just distributed GDOS with every machine - it is after all just another part of GEM.

For some reason this reminds me of Atari's policy on the distribution of the Epson emulator for the Atari laser printer. It was written by DMC (from Germany, the people who wrote Calamus, I think). In the USA, Atari has released version 1.31 as freeware. In the UK, Atari are selling v1.00 for 30 pounds (just under $60 at current rates). Now, I bought the UK version before the USA version was released. A friend has since sent me the USA version and, as it seems to have fewer bugs and a better set of fonts than the UK version, I use it. Am I legal or not? Would the situation be different if I hadn't bought the UK version?

Well, not quite. I can't speak for other vendors, but Apollo C on our 68k workstations can also insert padding between structure members to long-align them. (A 32-bit fetch of a long-aligned object will run slightly faster than a fetch of an odd-word-aligned object.) On a DN4500, for example, your example struct would also be 32 bytes big.

That'll teach me to post before the morning's caffeine takes effect. Forget what I said about Apollo C (it really will only word-align Howard's struct members). However, I don't see any reason why a compiler *mustn't* long-align struct members, can you? Aside from that it wastes space; I'm mean, in an idealogical sense. It sounds like something you shouldn't depend upon.

I would like to know if there exists a reasonale spreadsheet for the Atari ST. I am in the way of doing some serious work, apart from programming, and I would like a good spreadsheet.

I have looked at an older version of K-spread II, and it didn't suit my needs, to be frank, it was lousy. I need something in the class of Lotus 123, Microsoft Excel, or Wingz. If there are no such spreadsheets around, I'll install MINIX on my ST for good, and buy myselfe a Mac for serious work.

terjeb@eik.ii.uib.no - si0_tb90020@debet.nhh.no

And the Atari ST version can be loaded from cs.uni-sb.de [134.96.7.254]. The
patches to Pari-1.34 are in /pub/atari/gcc/Libraries in the archive pari-st.zoo,
a binary for gp is in /pub/atari/bin/gp.prg. It runs on a machine with one
Megabyte. I have used the portable C version of the source as a basis and mainly
added the plot-functions for GEM-VDI graphics.

Please Listen !!!!! The TOS 2.0 never exists.

As far as I know, it is done by an irresponsible person who stole
an alpha test version of the desktop, put in version 2.0 title in the info
box and distributed among you guys. Since it is not an official release
version, Atari is not obligated to replace it.

And you heard it right, it is an alpha test version and it is very
buggy. If you insist to use it, that's fine with us. But don't complain to
us that it trashes your files or wipes out your whole partition.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello world
I have started using GEMINI and am finding it VERY good BUT (and this is
a big BUT)

My version of the Sozobon compiler (1.0?) bombs whenever I run any part of
it..

I replaced hcc, jas, and top with version 1.2 that i downloaded from some BB
a year or so ago and all the Sozobon bins still bomb.

Any applications produced with my version of the copilier bomb...

I have had a couple of hints about the problem (memcpy or something)..

BUT 'TOHRU NISIMURA's' new and improved version 1.2x of top doesn't bomb
under GEMINI - so, here is a guy who knows where his towell is!
Congratulations TOHRU

SO, is there somewhere in netland, a set of sozobon bins that all work with
GEMINI, or a set of sources and instructions....

Here's hoping
..Clive

I ran into the same problem years ago between Suns (1s) and Vaxen. (Plural of Vax :-) Since we weren't sure at the time what else might be called for in the future, we started reading and writing structures as the component independent low level objects (shorts, longs, and bytes), and since we also wanted to be prepared for *byte-order* variations, we used the byteorder macros used for networking portability (htonl, htons, ntohl, ntohs) so it could run on *anything*. On a Sun 2/3/4 these are null macros, since the size and byteorder of shorts and longs are the network standard. Other machine architectures (like Vaxes, '386s, etc.) provide macros to convert to and from network standard sizes and orderings. You still have to fool about a bit with ints: I always casted them to longs to be safe before converting :-).

Haven't had a bit of trouble since.

Moral: a little extra effort, even when it is *really* a no-op *now* may save a *ton* of trouble later.

Oh, yeah, and *never* trust compilers to construct structures in any *sane* way: if byte padding can take place, is there any reason for a compiler even to maintain the same order for components as declared within a structure?

Doug Monk (bro@rice.edu)

I just called Gribniff yesterday. I was told that it may be up to another four weeks before I see my copy due to "overwhelming demand." Frankly, I'm a little disappointed, considering its already been six weeks, and that was supposed to be due to "overwhelming demand."

I switched from NEODESK to DC DESKTOP because of NEO's method of handling installed applications made one of my most used programs incompatible. DC didn't have this problem. I sent in my upgrade to NEO because they fixed this problem and added the ability to place folders on the desktop. However, DC has now announced and upgrade that allows DC DESKTOP to place folders on the desktop. If I don't get my shipment soon, I may just cancel my order and get the DC upgrade.

I really like the NEO design better than the DC design (much less RAM overhead theoretically better machine compatability). However, DC seems to work fine, and I'm getting annoyed at Gribniff's delay without notice (I had to call them, and then they couldn't take the time to check on my order specifically).

Hmmph! Haven't heard of NeXTStep? It is generally accepted that NeXT has
the most user-friendly user interface in the whole business. If you only
use applications, you don't usually have to use Unix (with cryptic shell
commands) at all! And if you want to program, the NeXT is much more
convenient than the ST is.

> There are also serious games for the ST and the Amiga
> that just will never happen on the next. I know that some people will scoff
> at this, but blowing away 50 buzillion aliens is a good way to blow off steam.

Well, SERIOUS games... There are much more games for the ST, but I think
there will be some very good games for the NeXT.

> I tend to see the NeXT as more of a work computer than a fun computer. If I
> want to do some serious number crunching, I'll do it at work. If I want to

Objective programming can be like playing good adventure games.

>
> dan.

Remember, NeXT is no old-fashioned Unix-computer. The power of Unix just
happens to be available (if wanted) all the time. I admit that if you
want to play games (and that only) the ST is much better choice. But if
you want to program...

Jouni

2917. Sozobon C and Mupfel

Newsgroup: comp.sys.atari.st
Date: 1990-11-01 11:42:24 UTC
From: jvt@its.bt.co.uk
Message-ID: <0M9%LP#@uzi-9mm.fulcrum.bt.co.uk>
Source record: 237680
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I hope someone out there can point me in the right direction to solve
this one.

I have been running Sozobon C under Gulam quite successfully for
some time now. Just recently I loaded Gemini (UK version) and
tried my applications under mupfel. They bombed (3)!

Wondering if it was my code, I wrote a trivial program "Hello World".
It also bombed no matter how I declared main().

Feeling rather devilish, I ran the compiler under Mupfel and it too
bombed. At least there's hope that it may not be just me.

However, the author of cmd.prg (sorry I've forgotten the name) announces
his code is compiled by Sozobon. It runs OK!

This last point makes me think its me & not the compiler of Mupfel.
Has anybody had this experience & know how to stop it? Kit is 1040STE.

Answers by e-mail preferred as my newsfeed has been disrupted of late.
I will summarize any replys this way.

John.

There are several decent spreadsheets. I use VIP Professional and am
happy with it. It is compatible with Lotus v. 1, and I hear that some
of the other spreadsheets offer v. 2 compatibility. VIP is available
in both GEM and 1-2-3 look-alike versions.

>Nope. So how about TOS 3.0 in a hard drive bootable format. I have said
>it before and other people have said it before- we don't NEED it to be in ROM!
>It would certainly stop the use of TOS 2.0.

This sounds like a good idea. Most people nowadays have at least 1Mb of memory
so a couple of hundred K for TOS should not be bad news. Real machines boot
from hard disk and this will give the ST a standard and easy method of OS
updating. Yes, it will take longer to boot, but the person who switches his
ST on for five minutes then goes away is not really the person who demands a
better TOS (imho).

I don't even have a hard drive but I would consider it a worthwhile expense if
TOS 3.0 were hard disk based.

Whether or not this will happen is, of course, out of the hands of mortal men.

Dave.

2923. New Sample Progs & MIDI

Newsgroup: comp.sys.atari.st
Date: 1990-11-01 17:41:47 UTC
From: patrick@hpmcaa.mcm.hp.com
Message-ID: <760020@hpmcaa.mcm.hp.com>
Source record: 237684

Last Night I saw a few New Programs at the Local Atari Dealer.

TCB - a STE Compatable sample sequencer and player $89.95

ST-Replay Professional - 3 Programs and A new Replay Cartridge $199.95

TCB: The package description left alot to be desired. No Screen shots and
a poor description of the capabilities. This package will sell by use and demo.
Luckily the TCB was running on an STE in the store. I thought it was a game
intro running. The music and sequencing was fantastic! I watched as someone
in the store played with the controls. It has a built in equalizer. It is
also capable of being used on a standard ST. My impression was that this is
a sequencer only product. Capable of playing samples in memory. MIDI support?
I believe the package stated MIDI IN/OUT capability. What's that mean?

ST-Replay Professional: A complete package containing 3 programs. A sampler/
editor, a Drum-Machine Style Sequencer, and a Sythesizer. The sampler editor
looks to have many more features than the standard Replay4. It had a picture of
a 3-D sound wave map. FFT? FFT was said to be supported. The Drum Machine
Sequencer "looked" full featured. It was stated to support Clock In/Out.
The Synthesizer Package was a full featured sampler. This software alone could
be worth the purchase price. It was capable of holding 30 Voices. It also
supported pitch bend and Portamento. I don't remember if it responded to
Velocity. Lastly the Cartridge. "Redesigned" 12 bit sampling cartridge to
play four voices at once through the cartridge port.

This is all from memory and a 'fuzzy' one at that. If you know more.....
please share. I'd really like to know the MIDI capabilites of these products.

2924. Dialog Manager source???

Newsgroup: comp.sys.atari.st
Date: 1990-11-01 18:02:51 UTC
From: saj@chinet.chi.il.us
Message-ID: <1990Nov01.180251.2762@chinet.chi.il.us>
Source record: 237685

Ok, we all know that the standard GEM stuff that draws and animates dialog boxes has 'quirks'. The standard advice has always been that if it doesn't fit your needs, the tools are there to make a new one that does. I find myself in just that position. What I need is a dialog library that works just a little differently than the built-in one, and that does the same thing on any machine that supports a close approximation to GKS. (That translates into English as it should be in C, and it should be adaptable to use the VDI on the ST or to use Meta Windows on the PC).
If anyone has this free, or for purchase without fees for distribution of programs incorporating it, I'd be interested.
I've looked at some text-mode window managers with dialog capabilities, and they're even farther from what I want than GEM is. I've also looked at Tim Oren's form_do() replacement, and that's what I'll start from if I have to do this myself.

>then it zooms the icon out then just sits there, no text display , and
>locks up the desktop.

Sounds to me like you have a line in your desktop.inf file that causes a
program to be run to view the file you are double clicking.

When you double click on a non-program file, you should see a dialog like:
SHOW | PRINT | CANCEL

The 'zoom boxes' indicate the desktop is attempting to run a program, and
is attempting to pass the file you double clicked as a parameter to that
program.

Look for a line in your desktop.inf file (probably close to the bottom) that
looks similar to:

#G 03 FF SOMEPROG.PRG@ *.*@

This line would be placed there if you did an INSTALL APPLICATION on some
program, and then typed in: *.* for the document type.

In response to a similar question issue raised in news.admin, Henry Spencer
posted the following.

|... the consensus opinion in the past has been that brief
|announcements with significant technical content are generally useful and
|should not be discouraged, while long press releases full of glowing
|adjectives are garbage which should not be inflicted on the net at large.

I agree. Information is useful. A long harangue that reads like a radio
commercial for a dragstrip is offensive. You don't have to be a rocket
scientist to figure out the difference. Now, could this issue be laid
to rest?

Having met Darek once, he strikes me as a nice guy, who has been bitten by shareware. I realised before I got caught up in it and sold my stuff off to publishers and then ended up working for one. But in the end it is the small time hackers/enthusiasts (no offence intended to anyone) who help to keep the ST market alive, so please people don't try to turn them into martyrs.

>Huh? Please, do tell more!

Gee, dunno for sure on that one, but Jim Allen has announced an '030 upgrade for Mega STs. (Won't fit in anything else.) To be available beginning sometime next month. Uses TOS 1.6, which is apparently fully compatible with the '030. The base kit will use the regular ST's memory, and there will be another board for using 32-bit memory. (No speed limit. If you can find 35ns DRAMs to fill it with, you can run at 50MHz and zero (!!) wait states.) Sounds really good. (Dunno how it's done, but he says the 32 bit RAM will be completely compatible with everything else, e.g., accessible to the DMA controller, etc.) I guess this is the result of all that time Jim Allen and Dave Small spent on the idea. Cool stuff. This has been discussed for a while on GEnie; I just phoned Jim earlier today to get details. There will also be a discount for current T16 owners. Dunno how much, I don't think any prices have been quoted yet.

Re: questions about Chaos Strikes Back...

It takes five items placed in the "Value for Valuables" area to open the
secret wall section...

The "coded scroll" CANNOT be translated... it was "left over" from something
that got cut at the last minute, but the scroll was accidentally left
in the game... (sure was fun trying to break the code though..! :)

There are FOUR pairs of Speed Boots, just like in Dungeon Master.. the
pair that's behind the shimmering RA door on the Fulya Pit level requires
you to already have one pair before the door opens... there's another
pair *well hidden* on that top level too...

A lot of the Dragon and RA armor are "random" items... that is, the
location of the individual items will change every time you begin a new
game... a few of the pieces of armor, like the Helmet of RA, are always
found in the same location, but most of it is random. There are a LOT
of hidden places for these things to end up in... you just have to
find them all..!
:)

The "official" FTL hintbook for Chaos Strikes Back should be available
soon, giving all the details you ever wanted to know about the game...

Does anyone out there have a Tweety Board?

I want to get one but I would like to hear from a satisfied customer as to how it both acheives the stereo effect and how it sounds.

Any idea on how much space the things takes up inside? I am planning on some space-taking upgrades to my 1040 and want to know how big the sucker is. Or if anyone knows if the 32K colour uprgade & 2Megs of SIMMS & the Tweety Board will conflict....I don`t have a RF thingy in there but the space does come in handy....

Also...is there ANY way I can upgrade to a 16Mhz 68000 and NOT lose Spectrum? Can I piggyback the puppies and just use a physical switch to toggle between them?

2940. Re: TOS 2.0

Newsgroup: comp.sys.atari.st
Date: 1990-11-02 05:55:10 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <35495@cup.portal.com>
Source record: 237559

Concerning whether Atari will ever release TOS 3.0 for lesser machines
than the TT, David Clear writes:

>I don't even have a hard drive but I would consider it a worthwhile expense
>TOS 3.0 were hard disk based.

>Whether or not this will happen is, of course, out of the hands of mortal me

Actually, of course, it's in the hands of those named "Tramiel"..

It's not what's "Right", it's not what's "Fair", it's not even what's
"Technically Feasible"..

It's what will make the most money for those named "Tramiel"...

If they can force you to trash whatever Atari system you've previously
paid for, and force you to buy a TT to get TOS 3.0, why would they give
away those profits..?

Atari Corp. will NEVER release a version of TOS for orphan computers like
the ST that gives the full power of TT TOS 3.0...

That's the way "big business" works, and that's the best way for Atari Corp.
... that's their right, and if you don't like it, tough...

2941. Re: DungeonMaster (CSB) & GO

Newsgroup: comp.sys.atari.st
Date: 1990-11-02 06:41:33 UTC
From: kllove@uokmax.ecn.uoknor.edu
Message-ID: <1990Nov2.064133.12448@uokmax.ecn.uoknor.edu>
Source record: 237561

Is there a listing of relative AC bonuses in Dungeon Master somewhere? How about CSB? By this I mean what kind of improvement to AC does a large shield give, leather armor, etc. What are all of the available clothing/armor that are out there?

On a completely unrelated topic: Are there any US companies that make a computerized GO? Everything I was told of was from Europe and the local store here had never heard of the companies (they import a lot of stuff for the ST and Amiga and, I think, IBMs). The specific implementation I asked about was Goliath (I even asked about the IBM version, still no luck). Is the company that released it still in business? When was Goliath released? Can anybody recommend anything else (and include a company name, if possible)? Is anybody here willing to part with their copy of Goliath? If you are, then how much?

Thanx for reading this,
Kenneth Love

2942. Looking for something to pack executables

Newsgroup: comp.sys.atari.st
Date: 1990-11-02 07:02:25 UTC
From: kllove@uokmax.ecn.uoknor.edu
Message-ID: <1990Nov2.070225.2580@uokmax.ecn.uoknor.edu>
Source record: 237562

I got packice.prg and it packed the files I wanted it to, but they wouldn't work afterwards, plus it took 35 to 45 minutes to pack each one. Is there any thing out there that can pack or crunch or whatever an executable and have it work after its through? It would be nice if they were able to be un-packed.

Oh yeah, in case anyone was wondering the files were Nethack (v2.3?) and Moria (v4.87???). I'm not sure of the version numbers on those. BTW, what are the current version numbers of these two and Larn? Is anyone ever going to port Omega (the Unix game not tanks) over to the ST?

Kenneth Love

2943. ST MicroEmacs Site Needed

A while ago I summarized all I knew about program packers; the best one I knew of then, and know of now, is called pfxpack.ttp. It will do all you want; try it.
I uploaded it to atari.archive a while ago; the file is (I think) in atari/util, it's called pfx.zoo. It may still be in the newitems dir too.

Enjoy! Jeroen.

>- What is the difference between GEMINI and VENUS as they look the
>- sameish to me.
>
>I'd like to know this as well. Is Venus and Mupfel just the GUI and
>CLI of Gemini in separate forms?

Yes, thats the way it is, Venus is the graphic-shell und Mupfel command-
line-interface. Gemini is both shells combined in one program. Venus do
not perform file-commands (copy, delete, ...) itself, it needs Mupfel to
do other things than just starting programs and managing itself.
A hint: try to get Gemini V1.2, its realy superb and has many improvements.
But i'm not the one to tell you this, i'm shure you soon will read something
about the new version...

2949. metafont and .tfm problems

Newsgroup: comp.sys.atari.st
Date: 1990-11-02 17:34:35 UTC
From: david@doe.utoronto.ca
Message-ID: <1990Nov2.173435.15558@doe.utoronto.ca>
Source record: 237566

I have metafont from atari.archive, and I have been having problems
with it. The .tfm files which it generates are not entirely correct,
and when I try to initex plain.tex, it rejects them (otherwise,
DVI programs say that the font does not match the .tfm file).

The package from atari.archive comes with virmf, but not with inimf,
so a better package would be nice for all of us. Is there one anywhere,
maybe at a German site?

Please follow up directly to the net, since this is a general interest
question.

2954. That Hard Day's Night thingy

Newsgroup: comp.sys.atari.st
Date: 1990-11-02 18:56:35 UTC
From: jfbruno@rodan.acs.syr.edu
Message-ID: <1990Nov2.185635.22887@rodan.acs.syr.edu>
Source record: 237576

(no, not the chord) I've seen several versions of what line comes before "'Cause when I get you alone'" here, but I always thought (and I just heard it now) it is:

"So I've an urge to come home
'cause when I get you alone
you know I fee-eel oa-oa-kay"

Please, tell me I haven't been wrong all these years?!

---jb

PS - my two volume 'Compleat Beatles" says 'So why I love to come home, 'cause ...', which DEFINITELY sounds WRONG.

PPS - Actually, it sounds like "So I an urge to come home", but I know they _really_ meant "I've".

Source record: 237570

In article <591@fsucs.UUCP> boyd@nu.cs.fsu.edu (Mickey Boyd) writes:
>[wants to know about Personal Pascal 2 bugs etc.]

Apparantly 2.0 had 2 problems: could not compile desk accesories
and it could not pass procedures as parameters. I haven't tried to use
these features, but I think my version is 2.05.
The GEM libraries are fairly complete, and if they are not enough
you can always create your own entry into lower level access to the
machine. I've done this, and it isn't too bad a system.
The editor is great! Fast, efficient, GEM-based. The only thing
that bothers me is that you can't save the settings.
Another feature I found useful was the ability to link in other
object files. I assembled something with jas.ttp (the Sozobon C assembler)
and linked it in, no problem.
I would love a comparison between Personal, Metacomco, and
Prospero. Can anyone do this?

From: icsu8053@attila.cs.montana.edu
Message-ID: <2866@dali>
Source record: 237579

According to the "About Opus..." dialog box in Opus 2.31:

" Thank you for becoming a registered user of Opus. This version of Opus
is for registed users only. Please respect my copyright and protect
your investment by not lending or otherwise distributing this program. "

Therefore, unless permission has been granted by Doug Harrison, this version
should NOT be distributed. He deserves some compensation for the amount of
thought and hard work he's put into this excellent program.

Opus 2.2 is distributable. The only major features lacking are the Lotus-
compatable file import & export.

Please remove Opus 2.31 from distribution IF Doug has not OKed it.

2965. Sozobon C A-Line

Newsgroup: comp.sys.atari.st
Date: 1990-11-03 02:51:57 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1990Nov3.025157.11211@lsuc.on.ca>
Source record: 237587

This has been a fairly mixed day for me. I've been writing
Line-A bindings for Sozobon C and testing them. For the most
part it's been fairly successful. During the morning, I wrote
a few that worked and I was feeling very happy waltzing back
to my computer after lunch. But the afternoon was not so
nice. I made a few changes that worked, but one has got
me stumped. It's not an entirely necessary function, since
I have an alternative which works, but is not crude.

The A-Line routines generally make use of a lot of
data located in an area that can be thought of as a structure.
But most of the functions use a lot of data and it's not
necessary to set them all for each function call. So I broke
them down into smaller specialized functions. Nothing new about
this. One of my function calls is FOREGRND(). The foreground
colour for most of the A-Line functions is set by 4 contiguous
'short' values starting at the 24th byte offset from the the
start of the variable structure

24 bit plane 1
26 bit plane 2
28 bit plane 3
30 bit plane 4

That looks easy enough. My first approach was as follows:

```
.text
.globl _foregrnd
_foregrnd:
; foregrnd(spntr,plane1,plane2,plane3,plane4)
; Line-A binding for Sozobon C
; By Jim Omura
bra L1
L0:
;var 4 8 _spntr
;var 2 12 _plane1
;var 2 14 _plane2
;var 2 16 _plane3
;var 2 18 _plane4
;
movea.l 8(a6),a3 ; A3 = spntr
move.w 12(a6),24(a3)
move.w 14(a6),26(a3)
move.w 16(a6),28(a3)
move.w 18(a6),30(a3)
```

```
;
L2:
unlk a6
rts
L1:
link a6,#-0
bra L0
.data
```

When I ran it with a test program, it worked. No surprises. But crude? Yeah. Why pass 4 ints for 1 colour register value? Better to just pass the colour register as a single int and then unpack it in the function call right? So I wrote the following:

```
.text
.globl _foregrnd
_foregrnd:
; foregrnd(spntr,colour)
; LINE_A spntr
; int colour
; Line-A binding function for Sozobon C
; By Jim Omura
bra L1
L0:
;var 4 8 _spntr
;var 2 12 _colour
;
movea.l 8(a6),a3 ; A3 = spntr
adda.l #24,a3 ; A3 points at Plane 1
move.w #3,d3 ; D3 = Loop Counter
move.w 12(a6),d4 ; D4 = Colour Reg.
;
DIST: ; Start Loop
lsr.b #1,d4 ; Shift bytewide right
; NOTE: Last Bit shifted out sets CCR Carry and eXtend Flags
bcs ODD ; Branch Carry Set

Well, as far as *I* can see, this should have worked.
It assembles fine. But when I ran it in my test program I
ended up with 3 Cherry bombs. Not fun. I've spent hours
trying to figure out what's going wrong, but I can't see
anything wrong with it. Well, if I did, I'd have corrected
right? :-) Can anybody see what I'm doing wrong here?

Cheers! -- Jim O.

- distributing this program. "
-
- Therefore, unless permission has been granted by Doug Harrison,
- this version should NOT be distributed. He deserves some
- compensation for the amount of thought and hard work he's put into
- this excellent program.

Ooops. He's right. I just checked it and version 2.3 and above is
only for registered users.

- Please remove Opus 2.31 from distribution IF Doug has not OKed it.

Yes, please remove it. I promise to be more careful in the future.
The person who gave it to me is a registered user, but I thought the
copy he gave me was still the PD version.

>(I think) but it does contain a login function. I have not tried it yet
>so I cannot help you on how well it works.

Try "Remote Access", it allows you to login to any ST Computers and gives
you full access to the system via a UNIX like shell. The login is UNIX
similar and need username/password. Remote Access can also be run as desk
accessory, waiting for a remote call or login.

The text version of VIP is faster because it doesn't have to update a
full GEM screen. However, I have found that any of several ways of
speeding up screen redraws make the perfromance of the GEM version quite
satisfactory.

I have LDW Power but haven't used it much, since I find that installing
GDOS fonts for all kinds of incompatible packages is a drag.

> Does anyone out there have a Tweety Board?

I've got one in my Mega.

>I want to get one but I would like to hear from a satisfied customer as
>to how it both acheives the stereo effect and how it sounds.

It would be worthwhile if more software took advantage of it. What it does is very simple. The ST sound chip produces 3 separate channels of sound. The 3 channels are combined in the ST before being fed to the audio-out line. The Tweety Board is mainly a set of small amplifiers, and a piggyback clip. The clip fits over the sound chip, and taking the lines for the 3 sound channels and amplifying them, then feeding it out to 3 RCA jacks. It's not stereo unless the software written for it is stereo. Some games are OK with it, but usually it destroys digitized sound.

>Any idea on how much space the things takes up inside? I am planning on
>some space-taking upgrades to my 1040 and want to know how big the
>sucker is. Or if anyone knows if the 32K colour uprgade & 2Megs of
>SIMMS & the Tweety Board will conflict....I don`t have a RF thingy in
>there but the space does come in handy....

The clip is the same size as the sound chip, and has a 6 inch flat ribbon cable leading to the amplifier board. That board is about 2 inches by 3 inches, and about 1/2 inch tall. See what you think...

>Also...is there ANY way I can upgrade to a 16Mhz 68000 and NOT lose
>Spectrum? Can I piggyback the puppies and just use a physical switch to
>toggle between them?

Two ways - the ICD accelerator lets you run at 8MHz as well as 16. Sounds like lots of people are happy with it, though on GEnie Jim Allen has been hinting that there's a design flaw in the ICD upgrade. (Apparently something Jim encountered when designing the T16, but he hasn't been too explicit.) There is also now an add-on for the T16 called a Whoa-Boy, which will slow the T16 down to 8MHz and make Spectrum stuff work again.

2971. help on drive mech change

Newsgroup: comp.sys.atari.st
Date: 1990-11-03 20:25:01 UTC
From: schaper@pnet51.orb.mn.org
Message-ID: <3410@orbit.cts.com>
Source record: 237596

I recently purchased a Toshiba 3.5" DSDD drive mechanism. I wish to replace the Chinon mechanism (SSDD) in my SF354 with this. The Toshiba is thinner than the Chinon. The back has a 34-pin connector (if I counted right) as well as a smaller connector. the board in the SF354 box has a ribbon cable connected to the Chinon via what looks like a `crimp connector' if that is a useful term. Likewise the smaller connector. How shall I do this? What is the right wire to pin connection? How shall I do this connection? Solder iron? (if so what wattage?, what type of solder, what type of heat sink if needed?) I want to use the full double-sided capability of the Toshiba, and I want it to recognize media changes.
Can anyone help me?
I seem to remember seeing posts on this in the past.
Any help is _much_ appreciated. I have no docs on the drive. The front is black, but doesn't look any different than the ones with the Mac plus colored front panels.
Sincere thanks

2972. New TT Desktop

Newsgroup: comp.sys.atari.st
Date: 1990-11-03 20:58:22 UTC
From: stephen@oahu.cs.ucla.edu
Message-ID: <1990Nov3.205822.4009@cs.ucla.edu>
Source record: 237583

Folks, it looks like some of the upper management at Atari is reluctant to release the nice new TT Desktop to the public on a disk... Personally, I think it would sell a lot of STEs. Obviously, people aren't going to buy an STE instead of a TT because it has the new desktop...

So, what's the best course of action?

We can write to Mr. Sam Tramiel, president of Atari Corp. and tell him what we want. If you'd be willing to pay for the new desktop on your old machine, tell him that. If you might buy an STE which had the new desktop included on a disk, tell him that... Tell him it will sell more STEs and Megas because it looks so much nicer than the old one and everyone else's machine looks better at the moment.

Anyway, you get the idea... I'm composing my letter now, and you can too.

Here's the address:

Atari Corp.
1196 Borregas Ave.
Sunnyvale, CA 94086

If enough of us write, it may happen.

Have a nice day,

Steve

ICD's new ADSpeed 16Mhz 68000 upgrade allows this. The switch is in
the form of a desk accessory (and I think an AUTO folder version too)
so you can view Spectrum 512 pics. The 16Mhz may also support
Spectrum 512 without having to switch, but I'm not sure.

I have a really neat version of GO for the ST called GO_BOARD. It looks slick, and appears to be freeware. If someone would send me some instructions, I will post it to comp.binaries or send it to atari.archive. It has some data files containing famous games in GO history or something (as you can tell, I am not yet proficient with this game :-)). Anyway, someone send me some instructions so you'all can see for yourselves!!

> crouland@gmuvax2.gmu.edu writes:
> Can anyone in netland please reccomend a reliable screen blanker,
> that
> crouland@gmuvax2.gmu.edu

Hi Chris,I was running into the same problem as far as the com port and ST Blank goes.I think,and I'm probably wrong about this,that any blanker that displays would interupt the com port.Least ways ,I haven't found one yet that works.
What I do use is Maccel 3,this works nicely in colour(don't know about mono),and the blanker that comes with Ramplus ver.122. Ramplus's blanker is just a colour alternator but it works well and I've had no problems with it blanking for extended periods of time(up to 24 hrs,others I've had lock up on me).
I haven't heard of any problems with either prg. on a mono,so you may wish to give Ramplus a try.

Hope this helps,
Kent

From: bayers@hub.cs.jmu.edu
Message-ID: <1990Nov5.014217.16763@hub.cs.jmu.edu>
Source record: 237503

I'm sure I saw this same question at one point, but I'm going to ask it again.

I just downloaded gcc from atari.archive and can't even compile a hello world type program without getting the error:

stdio.h:60 : parse error at null character.

Now, I've searched all through the blessed file for it, deleting lines, adding lines, commenting out lines, and I can't get rid of it! I don't even seem to get it to stay in the same place (line 60) when I add & delete lines.

Please let me know immediately if you can, I'm working on a virtual file system for my operating systems class, and I really want to do it in ANSI C (anyone else burned about Mark Williams C not doing the upgrade thing?) I've been able to work my way around it by declaring the stuff I need inside my program, but it's a real hassle.

[...]
>Adam David. adamd@rhi.hi.is

Yes, I use a QL (although I'm taking medication for it :o). Are you aware
of QUANTA, the user's group? I have a 128Kb QL, Trump card giving the full
896KB, 2x3.5" dual drives, running under JS QDOS and Taskmaster. I generally
have half a dozen jobs running - e.g. two word-processors plus a background
task which automatically performs periodic saves of the documents, a database,
and various other odds and ends. You're right, QDOS is *miles* better
than TOS.
(I know, I ported the SME/2 real-time multi-tasking OS onto the Atari -
TOS really
is poor man's fare). Pity about the microdrives (blah!) and keyboard though,
Sinclair really did loose the [flag]ship for a ha'p'orth of tar.

2992. 256K x 8 SIMMS - $10 each all 4 for $35

Newsgroup: comp.sys.atari.st
Date: 1990-11-05 13:54:38 UTC
From: wwm@pmsmam.uucp
Message-ID: <1990Nov5.135438.26987@pmsmam.uucp>
Source record: 237512

I recently upgraded the memory on a friend's Mac SE and am left with (4) 256K x 8 SIMMS. I will happily sell them to one of you SIMM experimenters for $10 each or all 4 for $35, postpaid in USA. (Make me an offer I can't refuse if you don't like my asking price).

No warranty, but these WERE working well when removed.

Please enquire by e-mail.

I have noticed the same problem when using MTOOLS on a sun ss1+. My atari drive
just flashes back and forth between track 0 (where the fat is) and the disk
track on which the file starts (reading it over and over and over and ...).
This doesn't happen all the time, but often enough to be annoying.

Please read the whole message and don't try to interpret the message's
meaning from just one sentence!

Atari Corp never endorses users to use any illegal copy of any kind
of softwares including TOS. I have said enough before about the so called
TOS 2.0 and this will the last time that I will say it.

"PLEASE DON'T USE IT FOR YOUR OWN SAKE."

It have lot of bugs and they will screw you up sooner or later.

I rest my case.

>
>It's what will make the most money for those named "Tramiel"...
>

Therefore this would be the greatest idesa since the invention of ....
well of whatever. Just think of the money Microsoft makes with DOS upgrades.
DR has jumped on that bandwaggon and is selling a DRDOS upgrade.

A diskbased TOS would be just the same: release TOS 3.0 and sell it without
having to burn it into ROMS. The fix some bugs and upgrade to TOS 3.1 for
a more or less substantial fee. Again, no hassle with ROMS, quick turnout,
and many more people would buy it since it's so easy to install. When sales
drop of, fix some more or less trivial bugs and upgrade ....

And so on and so forth. At the same time make better machines and some day
everybody will upgradee anyway for the better performance if the new system
is relatively compatible to the old one and runs TOS 3.x.

Some day in the future you release TOS 4.0, 5.0, etc. And always there'll be
bugs to fix, features to add, upgrades to sell ... And all a lot easier than
with ROM based systems.

Yeah.
Martin

>According to a recent news article, NeXT sold about 7,000 machines in their
>first year. This does not appear to be enough to support large scale
>application development.

> ... but at the rate they are selling I would expect new software to
> appear much more slowly than it did for the ST.

Software sells for a _lot_ more money on the NeXT, selling 1000
packages at $2,000 is equivalent to selling 10,000 packages
at $200 or 20,000 and $100. Remember that the sale price to the
developer is the one he or she charges the distributor. The
price to the end user is about 40 - 50% higher. When is the
last time you paid $150 for a program for the Atari? Did
19,999 other people buy it to? (Probably not, selling 1,000
copies of a non-game type program on the Atari platform is
considered to be a major "hit") Add up the numbers for yourself.
1000 * 150 = $150,000. That is enough to pay for one full time
programmer for a year and have $50,000 left over. Advertising,
shows, and production will eat out most of that $50,000 leaving
about $5,000. It's really tough to make a living on $5,000 a
year.

3003. MTOOLS on Sparcs (Was Re: De-archiving)

Newsgroup: comp.sys.atari.st
Date: 1990-11-05 19:15:04 UTC
From: bro@eunomia.rice.edu
Message-ID: <1990Nov5.191504.7547@rice.edu>
Source record: 237523

The version of mtools I got would not work as compiled because it only wrote one copy of the FAT area. IBM's could read such disks, but my ST could not. Goofy behavior resulted.

The solution was to compile the file init.c with the DUP_FAT #define set. This makes the code that writes the FAT update both copies.

Remember: like all IBM formatted disks, these disks will not have a serial number, so your ST can get confused and write back the wrong FAT and directory information to them in some circumstances. I recommend using them as read-only disks unless you know EXACTLY what is going on.

Doug Monk (bro@rice.edu)

>I just sent emacs39.lzh (actually it's 3.925, but who's counting :^)
>to atari.archive.

Version 3.10 is much better, I think, because it has named procedures
rather than just macro numbers. You can do something like this:

```
store-procedure line2top
1 redraw-display
!endm

macro-to-key line2top M-!
```

This would be line-to-top-of-window, except 3.10 as distributed doesn't
have long-enough buffer names for all that (and doesn't have length
checking on strcpy etc. :-( )

In addition, I think 3.10's search functions are LOTS faster, but that
could have been in 3.9: was searching in big files slow in 3.8 but fast
in 3.9? If they're the same speed then 3.10 is a BIG improvement.

I have found that the problem, when it crops up, can be eliminated by defining __NO_INLINE__ (or whatever the macro is). I think that it is absent from the new mintlib.

Source record: 237528

I talked to the Gribnif guys and gal at the Boston Atari show and they gave a couple of reasons why they were taking so long.
1. There were many more upgrades than they expected.
2. All the Atari shows came up rather close to each other (generally about a month between them.) This, they said, was contributing greatly to the turnaround.

And no, I haven't seen my upgrade yet either. Oh well. 2.05 is good enough for now.

3009. Compiling MiNT libs

Newsgroup: comp.sys.atari.st
Date: 1990-11-05 21:25:16 UTC
From: sinner@csd4.csd.uwm.edu
Message-ID: <7444@uwm.edu>
Source record: 237529

How can I compile on my ST the MiNT library modules with names
longer than xxxxxxxx.o ?

(I am using GCC.)

Alternatively, has anyone already compiled them and is planning
to send them to atari.archive?

Thanks much,
ken e sinner.

> --
> -- Howard Chu @ University of Michigan

Hi Howard,
When I spoke to Jim at the Boston show, he said a price of ~$995 for the
bare 68030 @16MHz (Tos 1.62 included) board. A 68882 would be extra.
Faster clock rates would be available (also as upgrades) and the ram
expansion board would a small extra too.
The board looked great! It was very compact and still left the Mega's
expansion slot open for such things as the Moniterm or Appletalk (gimme,
gimme) boards. It fit towards the bottom of the Mega so you can't still
have an internal hard disk. The ram board would then fit between it and
the floppy. Good stuff. Jim was a really pleasure to chat with. Nice
guy.

3015. Hard disks and stuff

Newsgroup: comp.sys.atari.st
Date: 1990-11-06 04:45:30 UTC
From: boyd@fsucs.cs.fsu.edu
Message-ID: <606@fsucs.UUCP>
Source record: 237535

Well, I bit the bullet and bought a hard drive. I was planning on rolling my own, but $574 for an 85mb was too good to pass up. It was bought from D&P Computer Supply in Ohio. Mech is a ST296n 5.25", ICD Advantage host, D&P's own custom case (under the monitor dual 5.25" devices). The ICD software has improved greatly since they came out with their new boards. The enclosure is really nice, with a front mounted power switch, removable power cable, and cable access hole in the back (for installation of a floppy or such). My only minor gripe is that the fan is kinda loud (my hair flaps when I sit in front of the thing :-)). Guess that's ok though, no chance of this one overheating! I was told that Seagate has dropped the price of the 296n's considerably, hence the low price. Just thought I would pass the word.

I am in no way connected with D&P computers, other than as a satisfied customer.

3016. Gulam, Unixtkit, and diff

Newsgroup: comp.sys.atari.st
Date: 1990-11-06 04:53:21 UTC
From: boyd@fsucs.cs.fsu.edu
Message-ID: <607@fsucs.UUCP>
Source record: 237536

Well, now that I have a hard drive :-) I have had a chance to explore Gulam. This is a really neat program! I also am very impressed with the binaries from the unixtkit (both of these available from atari.archive). By merging these two together I have managed to come up with a reasonably complete Un*x like shell for my ST. The one program that neither has that I really miss is diff. Does anyone know of such a program for the ST? By the way, thanks to all for responding to my question about less.ttp. It is great, and displays the man pages for unixtkit quite nicely.

3018. PostScript Problems on HP Laserjets with PS Cartridges

Newsgroup: comp.sys.atari.st
Date: 1990-11-06 07:27:57 UTC
From: geoff@nluug.nl
Message-ID: <688@epd74hp.nluug.nl>
Source record: 237538
Cross-posted to: comp.sys.atari.st,comp.periphs.printers

I have an HP Laserjet Series II fitted with the Pacific Data PostScript cartridge attached to my Atari Mega ST4. Using the Spectre Mac emulator, I have been happily using Word (and other SW) to prepare PostScript files via the Laserwriter printer driver and the SerialPrint Desk Accessory to print them out.

Recently a friend with the same setup invested in an HP Laserjet III with the HP PostScript cartridge, but we can't get the printer to produce anything.

Using the SerialPrint program on his system, data is transferred to the printer (and the "processing data" message appears on the control panel), but instead of producing hardcopy, the LJ III appears to just swallow the data. I have checked the SerialPrint settings on both systems, and they are exactly the same (^M for end-of-line, ^D for EOF). A PostScript file produced on his system will print out fine when transferred to my system.

It looks as though my PostScript clone (PacificPage) is actually working better than the HP PostScript cartridge which has the official Adobe implementation!

Does anyone have any idea about what might be going on here?
Thanks in advance
Geoff Coupe

3019. GNU File Utilities 1.4 & MiNT

David> with it. The .tfm files which it generates are not entirely correct,
David> and when I try to initex plain.tex, it rejects them (otherwise,
David> DVI programs say that the font does not match the .tfm file).

Are you sure, that you mean 'initex'? 'initex' usually don't need any
fonts, since it is only used to create a 'dumped' format from
'plain.tex' or 'lplain.tex' for faster loading by 'virtex'. Only
'virtex' should complain, if a .tfm is not available, when you are
compiling a document.

David> The package from atari.archive comes with virmf, but not with inimf,
David> so a better package would be nice for all of us. Is there one anywhere,
David> maybe at a German site?

Inimf is not quite so important as is initex. Since my first metafont
setup I've never run inimf again. But part of the package should then
be a file like 'plain.base', which should be a 'dumped' version of the
metafont basics and should contain setup parameters for various printers.

3023. Announcing BackupST: a nice backup utility.

Newsgroup: comp.sys.atari.st
Date: 1990-11-06 12:26:15 UTC
From: edwin@praxis.cs.ruu.nl
Message-ID: <4200@ruuinf.cs.ruu.nl>
Source record: 237543

We're very glad to announce the availability of a real nice
and useful backup program for the Atari-ST: BackupST, written
by Fred Appelman <fred@cv.ruu.nl>.
The package consists of two programs, BackupST and Bfront, and
some documentation written in LaTeX.

BackupST treats a set of floppy's like a stream of data: no floppy disk
space is wasted by creating subdirectories etc. Compare it to the UNIX
"tar" utility if you wish. One of the best things of BackupST is its
powerful restore mechanism (yes, you really might want to restore some
files occasionally :-]). I like the interactive restore best: people
familiar with the interactive-restore-mode of the UNIX "restore" command
will encounter no problems at all using this facility.

PLEASE NOTE THAT...

... I didn't write the program, Fred did. However, I like the tool and
offered this means of distribution. Any comment, complaints etc. should
go to Fred Appelman <fred@cv.ruu.nl>, not to me.

BackupST
----
this is the low-level program that does all the dirty work; this
is typically something that you use from within your favourite
shell (command line interpreter). Yes, is has __many__ options ;-)

Bfront
------
this is the GEM frontend for BackupST: once you've seen it, you'll
never find yourself going back to using the low-level program...

Ok, enough hype, now for how to get this stuff
==

*****> by anonymous FTP:

Site: archive.cs.ruu.nl [131.211.80.5]
Login: "anonymous" or "ftp"
Password: your email address (you@your_domain)
Usage: see the ftp(1) manual on your system
File: pub/ATARI-ST/utils/backupst.zoo
Important: don't forget to set binary mode.

*****> by our Mail-Server program:

1) The Mail-Server can be reached at the address

mail-server@cs.ruu.nl

or the old-fashioned path alternative

...!uunet!mcsun!hp4nl!ruuinf!mail-server

2) The Mail-Server understands a couple of commands, all commands
must be in the message body. The first thing you might want to
do is ask it for help:

send HELP

3) The Mail-Server will send you the UUENCODED BackupST package
if you put the following commands in the message body:

begin
send ATARI-ST/utils/backupst.zoo
end

That's all for now. If you encounter problems using the FTP service
and/or the mail-server, feel free to drop me a line (by e-mail, please).

thanks for your time, enjoy,

>
> It have lot of bugs and they will screw you up sooner or later.
>

Hello Derek,

in germany i have heard of a 'new' problem... Someone took the TT-Desk
right out of the ROMs of an TT. This version has all features, the TT-Desk
has. Like the TOS 2.0 you are talking of, the TT-Desk is a software that
must start in the auto-folder. Since it is the same AES as in the orginal
TT with TOS 3.01, it has the same 'bugs', a normal TT user has to live
with. I don't have it and i know it is absolut illegal, but i think it
will spread very fast.

I just wanted to tell this. If someone 'else' could do this, i think it's
also possible for Atari Corp.

Sincerely, Karsten ki@opal.cs.tu-berlin.de

In article <5556@uqcspe.cs.uq.oz.au> marshall@batserver.cs.uq.oz.au writes:
>I have a 1meg 1040ST, with TOS 1.0 :-(
>What buffer sizes should I set for Uniterm, if I want to run zmodem from
>within Uniterm? And which buffer goes with which size? Thanks.

Although you can run rz/sz with about 90K of memory, I would suggest giving 200-300K to them. Just increase the buffer called SYSTEM to 200-300 and you should be able to run these programs just fine. All the extra memory gets used for the history buffer anyway so you really only need to budget UniTerm about 250K.

BTW, this is the BEST ST terminal package I have ever seen...bar none.

Enjoy!

Chris

Atari items for sale , asking $1000.00

Hardware:

Atari 520STfm - This is actually a 1040, it has a 1040 motherboard,
double sided internal drive and 1 Mbyte of memory.
The mother board has a spot for a blitter chip.
Atari mouse
SM124 mono monitor
Taxan color monitor
Monitor Master - allows switching between the two monitors by
pushing a switch.
SF354 external single sided disk drive
5 1/4 external disk drive - works with PC-Ditto.
Magic Sac+ - Mac emulator
Atari joystick

Software:
The following were bought in the last two months and include
documentation and registration cards;

1st Word Plus
Laser C
Laser DB
Quick ST II
Quick Tools vol. 1

Older but with complete documentation;

Personal Pascal
AC/Fortran Compiler
Dr. T's Kawai - K3 Patch Editor
Magic Sac software
NEOchrome
Atari Language Disk - Basic, Logo, etc.
Michtron Super Conductor - a midi sequencer
Start Disks

Educational software for early grade school;

Magical Math 1
Spelling

Games with documentation;

Puffy's Saga
Dungeon Master

Marble Madness
Starglider
Defender of the Crown
Barbarian
The Hitchhiker's Guide to the Galaxy

Public Domain Utilities and games which I will include, includes
Sozobon C, Mint, CPM emulator, Midi sequencers, Adventure and much more.

Grant Grovenburg

>
>Yeah.
>Martin

Differing Opinion:

- I happen to like having TOS in ROM. The machine boots faster and is
less susceptible to viruses. (This is a MAJOR benifit, IMHO.)

- Upgrading to TOS 1.4 was no hassle. I took my machine down to the
Atari dealer [I realize a lot of folks have no local dealer :-( ] and
got it back the next day with TOS 1.4. Cost me $100 which is about what
going out and buying the new MSDOS 4.xx would cost. Also, I don't upgrade
(any OS) just because a new version comes out. (For example, I would
just as soon stay with MS-DOS 3.3 as buy 4.xx.) I suspect a lot of
people might be in this category, so why bother if it is not a MAJOR
improvement.

- If you want new features or functions, buy NeoDesk or DC Desktop.
Neodesk 3.0 (even 2.05) is fantastic. Although I have not seen "TOS
2.0", I would be willing to bet the NeoDesk 3 compares very favorably
(probably even against TT TOS). DC Desktop enhances the existing
desktop with add-on modules that add many useful features. Both are
excellent pieces of software.

- I don't understand why everyone keeps banging on Atari to release the
TT TOS for the ST/STE. First of all, that would impact both Gribnif
(NeoDesk) and Double Click (DC Desktop). We already know how few GOOD
developers support the ST market, why make it tougher. Secondly, if
Atari came out with the TT TOS at (say) $70-$100, who would buy it? The
same people that are NOT willing to spend $30-$50 on either NeoDesk or
DC Desktop? Yeah, sure.

I just had to get this "off my chest". :-) Please send flames to
/dev/null.

++ Not wishing to sound too dumb....
++ But what are you ment to do with .dif files....

++ puzzled - (what magic utility merges them?)
++ ..Clive

I feel it's worth posting a public answer, as it's a non-Gem area really.

Diff files represent the difference between two (text, usually) files.

This a common way of distributing optional patches to sources.

If a diff file represents a set of patches (sometimes across a number of files) the patches can be automagically applied using Larry Wall's "patch" program --- patch < source.dif. Both diff and patch are available on atari.archive.umich.edu

The tos/minix ports of GNU C are embodied in a diff file. Which leads me on ...

Graham (puzzled?, wait till you *use* it!)

3030. ballzone (arkanoid clone)

Does anyone have the 'ballzone.lzh' file from atari.archive which was recently uploaded? I have it installed on my system and I'm impressed with the way it plays. It seems very well done, with the small exception of being able to quit gracefully. I am forced to reboot and lose all the high scores. Is there a way to quit without rebooting? Imagine, all that thought put into this game and no way to quit?

3032. A-Line Solution, AES and VDI

Newsgroup: comp.sys.atari.st
Date: 1990-11-06 17:18:58 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1990Nov6.171858.11434@lsuc.on.ca>
Source record: 237451

I've received a number of responses regarding my questions
and I think I've replied to most of them. This will summarize
the information I have received.

Regarding AES and VDI calls from a .TTP program:

It seems this is possible. Some of you have done it.
I'll read my reference material again with this in mind and
I think eventually I may try it out on one of the programs I'm
working on.

Regarding A-Line Calls:

The problem is solved! But before I get to the solution,
I'll mention some other things that have arisen.

1. Sozobon C and bugs. This wasn't the problem, but it seems
that early versions of Sozobon C had problems with some bitwise
code on the assembler level. I have not current evidence if
my version has such problems. I should state that I'm using
a slightly modified version of Sozobon 1.2. The modifications
were made to the TOP optimizer by Ian Lepore on BIX. The
information I have is that TOP is NOT reliable and should NOT
BE USED AT ALL unless you know how to correct it. Ian's version
has been submitted to the Sozobon authors and the last I heard,
no decision had been made about his corrections. I trust
Ian's judgement on this matter and I'm using his corrected
version of the TOP optimizer. Although I've found a couple of
other bugs since then (one HCC level bug and one Dlib level bug
and maybe one or two others), it's been quite usable.

2. I have received a header #include file from J. Henders. When
I double checked my version of DLIBS, my documentation doesn't
indicate support for the A-Line functions listed in the header
file. Either they simply didn't document it or you've got a
later version of DLIBS. Be that as it may, looking at the
header was helpful, but I decided not to use it. The problem
is one of standardization. I'm basing my variables on the
information in "Atari ST Internals." Despite the bugs in the
book, they claim to be using "official" Atari Corp. variable
names. I think there might be some value in developing code
using these names as much as possible, so I've decided to keep
them. Otherwise, looking at the variable names for inherent
value, it's sort of a toss up. Both sets of variable names
have some good points and some bad points.

3. THE SOLUTIONS to my A-Line routine problems:

The problem seems to have been caused by my using d3, d4 and a3 registers without storing and restoring contents. I'll start at the beginning. The Sozobon documentation regarding register usage says only this:

P. 5

"Any of the basic data types may be declared as register variables. Pointers occupy the A registers, all other types are placed in D registers. Five data registers and three address registers are available for use by register variables."

P. 6

"The components of the Sozobon compiler were developed by replacing pieces of the Alcyon compiler one by one."

" ... The output of the compiler is suitable for input to other compatible assemblers such as Alcyon's assembler or the MadMac assembler."

The Sozobon Assembler likewise produces object files that will link under Alcyon and Sozobon's linker will accept Alcyon object files and libraries.

As such, Sozobon can be assumed to be using Alcyon register usage practices. That's nice, but I don't have Alcyon documentation, so I had no idea what those standard practices are. :-)

P. 7

"The compiler uses the 'normal' 68000 C calling conventions. Register A6 is used as a frame pointer, and function return values are placed in D0. Registers D3-D7 and A3-A5 are used to hold register variables."

I'll assume that this is somehow "normal." I haven't really looked closely at a lot of C compilers, but it still left out a lot.

At this point I did my usual trick of partially compiling a "model" program to see how variables were being passed and started in writing my functions. And they worked. At least they worked as far as I tested them. I assumed MISTAKENLY that the compiler was storing 'register' variables *before* making the function call and restoring after the return. This is my own convention when I write pure assembly language. As has been pointed out to me long ago, this is not necessarily the way a compiler will do it.

So the first possible solution was simply to stack and unstack the registers I used inside the functions I've written.

Hugh Redelmeier provided what is probably a better solution.
It's the solution I'm using for now. The problem is that it
is based on an assumption. But it's a fairly safe assumption.
Apparently it is common to use A0, D0 and D1 as scratchpad
registers. Looking at the documentation again, it seemed likely
that Sozobon assumes A0 to A2 and D0 to D2 all as scratchpad
registers. Proper usage of a scratchpad register assumes that
these registers can be corrupted in any called function, so a
called function should not have to stack them and unstack them.
Hugh provided a version of the function that worked. In fact,
I decided to *slowly* mutate my function closer to his version
so I could try a few things along the way and see the results.
I've learned quite a bit.

```

NEXT:
dbra d2,DISTLP ; End of Loop
;
unlk a6
rts
.data
```

The above version has been tested and works. I've changed all the functions I've written to conform to the assumptions that the lower number registers are scratchpad and can be used in this way. Unless I find out otherwise, this will be the style I'll be using in the future.

One difference from Hugh's version was my NOT using D0. Since D0 is used for return values, I tend to leave it till I need it. This can be helpful when writing long, complex functions. That is to say, sometimes it affects optimizing if you plan your register usage backwards. In this case it's fairly clear that it won't matter, but I've had it strongly ingrained, so I've not used D0. No real reason not to. :-)

This isn't a flame. I can only speak for myself, of course, but the reason
_I_ keep clamoring for the TT desktop on STs and STEs is to stimulate new
sales. The new desktop just plain looks better than the old one. Unless you
bundle DC Desktop or NeoDesk with new STs, the computer people see in the
stores will have the nasty old desktop while other computers have nice slick
looking desktops (e.g. Macintosh, new Amigas, Windows 3.0). Not selling any
new machines will have a much bigger impact on the companies you mention than
bundling the new desktop would. As you mentioned in part of your article that
I didn't quote, they can compete with the new desktop. It doesn't try to be
all things to all people. Actual operating system revisions have a similar
effect on new buyers.

Let's sell some machines, Atari!

3036. Re: TeX for ST

Newsgroup: comp.sys.atari.st
Date: 1990-11-06 20:54:15 UTC
From: gjh@hplb.hpl.hp.com
Message-ID: <GJH.90Nov6205415@ghiggins.hpl.hp.com>
Source record: 237455

++ Which files from atari.archive do I need for TeX, for a 1meg 1040ST with TOS
++ 1.0? And what is "undump" and what is "virtex", and how can I get
++ documentation that tells me what they are? Thanks.

Forget it unless you have an HD. If so, read on ...

you need *ALL* the files satisfying StTeX*.zoo, there *are* readmes with them.

Essentially, you need the bin stuff in a directory on your path, the
tfm (format) in \fonts and the tmac (macros) in \macros. There're some
environment variables which need to be set (TEXFONTS, TEXINPUTS, etc) they're
also mentioned in the readme.

The files in StTeXbin.zoo are :

```
365 27% 266 27 Oct 89 01:23:44 CONTENTS
4181 40% 2517 27 Oct 89 01:15:46 README
192535 30% 135148 30 Sep 89 04:11:36 bvirtex.ttp
10617 36% 6845 14 Oct 88 02:29:04 index.ttp
210524 31% 145589 24 Sep 89 01:54:08 initex.ttp
712680 53% 336136 29 Sep 89 02:45:46 latex.ttp
18014 27% 13183 25 Sep 89 15:03:12 undump.ttp
191712 30% 135079 29 Sep 89 02:45:56 virtex.ttp
-------- --- -------- --------- --------
1340628 42% 774763 8 files
```

Destructions for undumping are :

```
- to undump a preloaded version of LaTeX or TeX
undump LaTeX virtex.ttp &lplain
.......
* ^\ <== hit the quit character here. for
the Gnu C Library it is Control-\
(which means hold down the control key and
type the character '\' simultaneously).
This will undump a virtex pre-loaded with lplain.fmt,
called LaTeX.
Please NOTE: the second argument to `undump' must be
the *FULL PATHNAME TO VIRTEX.TTP INCLUDING THE EXTENTION*.
```

you'll need lplain.fmt (for LaTeX) or plain.fmt (for TeX) which are
in the StTeXmac.zoo file. Just follow the destructions ...

```
undump latex.ttp e:\texbin\virtex.ttp &lplain
^^^^^^^^^ ^^^^^^^^^^ ^^^^^^
1^ 2^ 3^ 4^
```

1. Go on, call it latex.ttp, just for fun

2. Do as the man says, give it a full, specific pathname

3. No, the ampersand (&) isn't a typo it's needed by virtex

4. make sure that lplain.fmt (or plain.fmt) is in the current directory.

You should then see a message from "Common TeX" and, eventually,
an asterisk prompt. When you see the asterisk, hit control backslash
and it will zark it out (fatal signal, quitting), but it *will leave
behind* an executable file, called whatever you gave as the first argument
to undump (1, above).

If you want a preview of how the tex-ed stuff will print, get hold of
one (or more) of the previewers (I like showdvi, there're others).

Have fun.

3037. Gnu Blues

Newsgroup: comp.sys.atari.st
Date: 1990-11-06 21:11:20 UTC
From: gjh@hplb.hpl.hp.com
Message-ID: <GJH.90Nov6211120@ghiggins.hpl.hp.com>
Source record: 237456

I've been experiencing a replicable problem with GNU C as available on terminator. I thought I'd have a bash at "bash" which somewhat cryptically appeared on the archives. It needs the GNU fileutils stuff (ls, cp, etc), so I've been trying to compile them up on the (newly-expanded) ST.

gcc-as started to barf on a number of files, I got gcc to drop .s versions and looked carefully, only to find a number of statements of the form ...

stab "e:\include\strings.h"

which was parsed (correctly) by gcc-as escape-i and escape-s. What I can't figure out is why this particular include appears, as no other one does. Anyway, I'm still getting "Bogon Alerts" from the compiler, even when I double-backslash the paths. What concerns me is that this is standard GNU distribution fileutils, GNU C shouldn't have a problem compiling it. O.K., whether it runs or not is another thing, but it should compile up OK.

I started to consider whether the GNU C port had some problem (after playing around with GNUINC = this-n-that for a while. It made no positive difference.

Any ideas anyone?

Gray (ever puzzled)

Source record: 237458

rgoseweh@digi.lonestar.org (Roy Gosewehr) writes:

- Differing Opinion:
-
- - I happen to like having TOS in ROM. The machine boots faster and
- is less susceptible to viruses. (This is a MAJOR benifit, IMHO.)

I agree. I thought this was one of the advantages of having the OS in ROM: fewer viruses. Isn't this why there are so many in the Mac and IBM world?

Moreover, not to give anyone any hints, but couldn't NeoDesk and DC Desktop be susceptible to viruses as well (even though I love NeoDesk with a passion)?

- - I don't understand why everyone keeps banging on Atari to release
- the TT TOS for the ST/STE. First of all, that would impact both
- Gribnif (NeoDesk) and Double Click (DC Desktop). We already know
- how few GOOD developers support the ST market, why make it tougher.

I think Atari would look better in the eyes of its users if they released their newer desktop. (Remember support?) The release would show that Atari still knows that it has users out there. On the other hand, it doesn't stand a chance against NeoDesk and DC Desktop in the marketplace; the others just have too many features. I think this is why Atari won't release it; why waste time and *MONEY* (first in the Tramiels' minds :^) when no one would buy it.

In addition, this point is also valid:

- Secondly, if Atari came out with the TT TOS at (say) $70-$100, who
- would buy it? The same people that are NOT willing to spend $30-$50
- on either NeoDesk or DC Desktop? Yeah, sure.

Exactly. Who would buy it, even if it was selling for the same price as NeoDesk or DC Desktop?

On the otherhand, if the new TOS had something that the others don't have, such as multitasking (e.g. MIDI-tasking), then I think there would be many people out there in line (or on the phone to their 400-mile-away, local dealer) to get it.

Ok, I'll byte. Tos 2.0 has lotsa bugs (dunno I've never seen it).
And... The bugs dont surprise me, considering the years it's taken to fix
Tos period (though at best its still lame). If it is dangerous to a atarites
computer, HD, files et al... Why... preytel is it floatin' around?
If atari itself cannot keep items like tos 20 under lock and key, this means
someone's handin; it about... correct? If, circumstantially mind you....
I got this item say from a users group or BBS and it had atari's name on it,
```

and... it wiped out say thousands of dollars of biz data (not that I'd use it for biz anyway) atari'd be hearin' from me... or a lawyer.... etc.
IF! in fact, it leaked out... every registered atari user should get a note from atari (maybe on a postcard of a pretty Sun) tellin' em' if they see it report it, relate its puter' poison... etc.

Is there any way to have CLab's Notator print in PostScript? I am looking
to send PostScript to a file to be printed out on my mainframe.
Do a lot of people own Notator? It has proven to be the best software
package for ANY computer for all midi applications. Is there a pd source
for notator songs or standard midi songs? For that matter, is there a
source of synthesizer sounds in standard midi format?

Source record: 237468

For what it's worth, I use _Analyze!_ It's inexpensive, and it works well. It supports GDOS for printing graphs and does it well, it's got macros, it can save/load Lotus 1-2-3 files (although I've never tried it), does most of the Lotus functions. Because it uses GEM, movement around the sheet can be sort of slow, but for the price (<$35), it's not bad. I use it alot for doing labs! (ARRRGH!)

3050. Spectre and Mac hard drives

Newsgroup: comp.sys.atari.st
Date: 1990-11-07 02:17:02 UTC
From: jfbruno@rodan.acs.syr.edu
Message-ID: <1990Nov7.021702.12848@rodan.acs.syr.edu>
Source record: 237470

Has anyone gotten Spectre to read a Mac hard disk (that is, a hard disk drive that was formatted on a Mac). Or, has anyone gotten a Mac to be able to read and write to a partition formatted with Spectre?? I have a SyQuest drive and I'd like to be able to FTP things directly to my hard drive connected to a Mac on campus and then be able to use the files with my ST running Spectre, but Spectre doesn't seem to want to read Mac cartridges. Is there a way around this? Is there some software for the Mac that will enable to read the Spectre partitions? Any word on when Spectre 3.0 will be out? Will it be able to do this?

Thanks in advance,
---jb

From: kentd@FtCollins.NCR.com
Message-ID: <KENTD.90Nov7101454@zappa.FtCollins.NCR.com>
Source record: 237473

Recently in this group, cross compiling ST programs on other systems had
been discussed. Inspired by this, I grabbed the Sozobon C sources (V1.2) and
"ported" them to my Sun at work and I was wondering if anyone would be
interested in the diffs to the original ST sources (No warranty, of
course :^) ?

It should compile on most UNIXes provided they support the system()
function (is this typically available? I dunno, SunOS, which is a BSD
derivative, is the only flavor of UNIX I've ever really programmed on.)

The vast majority of changes were due to word length assumption problems.

As soon as I'm able to get GCC sources, I plan on looking at porting it,
also. Unfortunately, that'll probably take several centuries seeing as
how I only have mail access to terminator! :^\

3054. Weird Uniterm behaviour...

Newsgroup: comp.sys.atari.st
Date: 1990-11-07 10:19:59 UTC
From: jeroen@plato.phil.ruu.nl
Message-ID: <922@accucx.cc.ruu.nl>
Source record: 237474

I have a trouble using Uniterm. I work remote on many machines; but my 'own' Sun gives me trouble. That is, I call the machine, I have to type my personal identification code, then it calls me back, I type my code again and normal login sequence starts. Weird thing is: I call and connect in 8 bits no parity, in which I type my code too (both times). But then the Sun's welcome message and login prompt appears ... in 7 bits even!
I thought this would be an error in the Sun's login sequence scripts. But it's not! I recently tried uw, and I logged in at 8-even, and, just to be sure to be sure, I tried other terminal programs. It's only in Uniterm that I have to switch back to 7-even!

I have Uniterm 2.0e011, but the same behaviour occurred in all previous versions
of the program I tried.

Does anyone know why this problem occurs, or how to solve it??

Thanx!

Jeroen (jeroen@phil.ruu.nl)

P.S. Even know I agree Uniterm is the best terminal program. No question about it.

3055. Re: TOS 2.0

Newsgroup: comp.sys.atari.st
Date: 1990-11-07 12:07:45 UTC
From: fk@vall.dsv.su.se
Message-ID: <1030@vall.dsv.su.se>
Source record: 237475

To throw fuel onto the old debate over ROM-based vs diskbased TOS
I'd like to point out an incident that may not only be my private
experience but is possibly shared by other ST owners around the world.

As I took my 1040 to the local repair shop for a new power supply
(it worked almost three years before it broke, not bad) I asked
for a new version of TOS to be installed at the same time. This
was promptly done but no clear statement was obtainable from the
repair shop exactly what version of TOS I was going to get. As I
went to fetch the computer I brought with me a compilation of net-news
comments (what lovely a source of information this network is) and
together I and the guy who had made the installation managed to
deduce that the 6-chip ROM set was (dont gasp) TOS 1.2. In september
1990! 1.4 has been around for a year, at least!

Anyway, It turns out that 1.2 is what they can get their hands on in
terms of *SPARE PARTS*. Get it? Not, system software, that volatile
substance we so dearly address, but little tiny chips which makes the
machine work.

Without any deeper investigation to back this up, it does gives one
pause for thought. For starters, ROM-based OS does give faster boot, a
better security against viruses, but also a slower rate of release and
bug-fixes. But the major impediment of ROMs is in my opinion that ROMs
that are once manufactured represent a significant investment.
Even when EPROMS are used the media is not as easily reusable as
when diskettes are used. This means that the investment must be
secured (ie the chips sold) before a new release is considered.
Naturally this encourages everyone who have obtained ROMs in order to
sell them further, to get their money back on old ROMs first.

I should point out that I did not buy from Atari directly (the repair
shop services several brands of computers) and if I had I may have
been able to obtain 1.4 or higher.

>
>- Differing Opinion:
>-
>- - I happen to like having TOS in ROM. The machine boots faster and
>- is less susceptible to viruses. (This is a MAJOR benifit, IMHO.)

It boots faster??? While this may save you 5 seconds on startup, I really don't think the pain in the ass involved in upgrading ROMS is negated by that. MS-DOS and Macs take a few seconds to boot, but I don't see people complaining about that. You just can't argue with the fact that the Mac and MS-DOS OS' have been regularly updated and cleansed of bugs. That is definitely worth a few extra seconds at bootup. Hell, there are/were bugs in TOS that people have known about for *5* years that have only just been corrected (like the 40 folder bug, the pool bug, etc...)!

>
>I agree. I thought this was one of the advantages of having the OS
>in ROM: fewer viruses. Isn't this why there are so many in the Mac
>and IBM world?

This is simply baloney. It is just as easy to write virii for the ST as any other machine. The reason you see so many more for other machines is because MORE PEOPLE USE THEM. If you have 50,000,000 people using a machine, the chances are greater that you'll have more miscreants writing virii than if you only have 1,000,000 people using the other brand. The fact that the OS is in ROM is really no big deal regarding virii.

>Moreover, not to give anyone any hints, but couldn't NeoDesk and DC
>Desktop be susceptible to viruses as well (even though I love NeoDesk
>with a passion)?

Any application is succeptible.

>- - I don't understand why everyone keeps banging on Atari to release
>- the TT TOS for the ST/STE. First of all, that would impact both
>- Gribnif (NeoDesk) and Double Click (DC Desktop). We already know
>- how few GOOD developers support the ST market, why make it tougher.

I think holding back progress to wetnurse a couple of devlopers would be counterproductive to the eventual success of the machine.

>
>I think Atari would look better in the eyes of its users if they
>released their newer desktop. (Remember support?)

Support??? Hehe, you must be kidding. This is comp.sys.atari.st, not
comp.sys.mac. Anyhow, I think it would be in their best interests to
do so also, though I think price is the most important factor in this
market segment.

>- Secondly, if Atari came out with the TT TOS at (say) $70-$100, who
>- would buy it? The same people that are NOT willing to spend $30-$50
>- on either NeoDesk or DC Desktop? Yeah, sure.
>
>Exactly. Who would buy it, even if it was selling for the same price
>as NeoDesk or DC Desktop?

That is why they should have a sane upgrade policy like Apple. Why
should a person get reamed over and over just to have the most
bug free OS? Jeez, you buy the OS with the computer so I think that
it isn't unreasonable to expect upgrades as they become available at
a reasonable price. $100 is 17% of the cost of a new 1040STe. If
you're going after the bargain-basement computer market, then you
can't expect to earn huge premiums on things like TOS upgrades.
People won't go for it.

>
>On the otherhand, if the new TOS had something that the others don't
>have, such as multitasking (e.g. MIDI-tasking), then I think there
>would be many people out there in line (or on the phone to their
>400-mile-away, local dealer) to get it.

Or you could just call up David Beckemeyer and get a multitasking
shell for the ST now and thumb your nose at Atari.

Cheers,

Chris

Stacy has been out for ages. Spectre GCR works fine with it, I think the only problem was getting the *HUGE* GCR cartridge into the Stacy cartridge slot... I'm sure this has been solved by now.

I'm sure someone markets a memory expansion for the Stacy, and I think Atari may/has/will come out with "Mega" Stacys-- i.e. 2 or 4 MB of RAM.

Actually, there's this guy here on campus who runs Spectre GCR on a Stacy souped up to run @ 16 MHz-- he got GCR to run at that speed (so I hear.) I don't know this guy personally, but given the fact that the only more technical university than Carnegie Mellon is (possibly) MIT, I don't doubt that this hacker guy has done it. I mean, people make their own bipedal robots here for fun...

Ah! You'll like your Spectre a lot better than your pcdittoII. Go ask a
Mac dealer about MacPrint. I know it supports several laser printers; it
might support the old Epson standard as well. $99 retail, and worth it.

BTW, if you're not too badly stung by the pcditto episode, there are other
PC emulators for the ST. Ask your local Atari dealer or user's group about
them.

- I was just sitting here catching up on news, when I should be
- sleeping,and thought to myself, gee wouldn't it be cool if neodesk
- were available as a cartridge? With some program in the auto folder
- to tell the system about it? Now that would be cool!!!

I asked Dan Wilga about this. Apparently, many others have suggested
this to him as well. He told me it would increase the cost of
NeoDesk way over $100.

It would be nice, however, because it would free up RAM, and when you
returned to NeoDesk, it would load real quickly.

>

This is pretty much the way I've been running for a long time, too.
I started with these and replaced modules as better ones became available.

Beware that some of the UnixTKit programs have bugs or just plain don't work.
I don't remember all of them, but make sure that you give each one a good
workout before trusting it. The only one I recall not working
right now is 'od'. I think the 'sort' and 'sed' are a little buggy
as well, but my memory is vague on that. I only know that I replaced
them with GNU equivalents.

There is a diff that works fine on panarthea.

You should also get one of the 'cat' replacements for gulam.

There is indeed a tos program in addition to an accessary that will
allow you to change the clock rate of your Turbo16 board from 8 to
16 Mz. The program/tos version can either be run from the autofolder
or the desktop. However, your board must be properly wired/connected
for these programs/accessary to work. There is a terminal on the
board (Turbo16) that must have a jumper from I believe pin 39 of the
Yamaha sound chip installed. Without that jumper , your board can
only run at 16Mz. I will check to see if programs have been uploaded
to any of the archive sites.

micro@imada.dk (Klaus Pedersen) writes:
>Shifter mode called "Sample&Hold".
>(the article said something about HAM and lotsa colors!).

SAH mode has nothing to do with lots of colors. What it lets you
do is draw filled polygons really fast. You can draw two dots
on the screen and get a solid line between them, without having
to write the color value to all the pixels in between in memory.
Example below.

> What happend to the 256 GRAYSCALE mode of the TT ?

It's there.

> What is the display reflech rate of the TT (TT-LOW/TT-HIGH) ?

That's "refresh rate" and the color modes are 60Hz no matter what
country you're in. TT HIGH rez is 1280x960 monochrome, and its
frame rate is 67hz, I think.

EXAMPLE OF SAH MODE:

In SAH mode, nonzero pixel values in memory appear as that color, and
zero pixel values in memory mean "continue with previous color." That's
why it's also called "smear" mode: a colored dot will "smear" to the
right until it reaches another nonzero pixel value.

In the diagrams below, a period (".") is a zero dot and a star ("*") is a
one. In addition, a zero ("0") represents a pixel value which has the
same color as the background. Let's say you want a picture like this:

```
........
..****..
...**...
..****..
........
```

You can get it by drawing this:

```
........
..*...0.
...*.0..
..*...0.
........
```

This means you only had to write six pixels, not thirteen. Of course,
this is just a sample: the savings is much more dramatic for bigger pictures.

(The trailing "0" in the second picture is what stops the smear from
going all the way to the right edge of the screen. The left edge starts
out in the background color.)

>This is simply baloney. It is just as easy to write virii for the
>ST as any other machine. The reason you see so many more for other

Yes, just as easy to write them, but when you have TOS in ROM that's one
less source of spreding infection. TOS in ROM can't be infected, Mac's
system and finder can and DO get infected all the time, and then spread
the viroids in their turn. I know, it's part of my job at school to
disinfect them.

>machines is because MORE PEOPLE USE THEM. If you have 50,000,000

this is also true.

>people using the other brand. The fact that the OS is in ROM is
>really no big deal regarding virii.

Except ROM OS can't be infected and spread it further.

>Any help out there?

As far as I know, the T16 doesn't have a true 8 MHz mode. The cache can be
toggled on and off, but the speed remains at 16MHz.

The AdSpeed ST board from ICD (same price, just faster) has a true 8MHz
mode that is compatible with programs like Spectrum 512, etc.

>-steve
>selick@bucsf.bu.edu

I fuddled with Neodesk at a local atari store and was thoroughly un-impressed.
The Mac is far far far nicer in this area, as is windows... I use both.
In fact, the lack of desktop alternatives that are decent are almost non-
existant... DC desktop... Nope. NeoDesk. Nope. Gemini... The best by a long
shot, and its shareware. It irked me so much I designed my own desktop
replacemnt (In deskcart ie: cartridge tradition) and decided that it would be
highly un-wise to waste my time on a complex product that would net me less
than a avg. janitor makes in like time. You may think thats BS. But it's not.
Trust me here... I've tried on SEVERAL occasions to make a decent living
on codin' ST software.... It just doesnt work. I've been contacted by a few
software development houses to code on the Amiga... I havent decided yet.
MacShareware pay's better than ST commercialware... Why?... We've discussed
it many time and I wont waste bandwidth/breath on it again. Anyway... Look
into Gemini desktop, you'll be pleastly surprised.

From: Seitz@cup.portal.com
Message-ID: <35717@cup.portal.com>
Source record: 237408

On Atari's TT desktop competing with 3rd party developers:

The best results seem to occur when the computer manufacturer develops a reasonably priced basic item (such as a peripheral or program). The existance of an item supported by the manufacturer builds consumer confidence by making the item widely available. Making the unit a basic model leaves room for other developers to enhance the product.

Take hard drives for the Atari ST. When Atari produced a hard disk for the ST, that gave a baseline expectation for the capabilities of the machine. Consumer confidence is bolstered by knowing there is an easily available, manufacturer supported hard disk. On the other hand, by not underpricing the unit, Atari allows 3rd party developers to thrive by providing less expensive, improved version.

Desktops work the same way. Atari's desktop will be viewed as the "regular" or "average" configuration. When people compare Ataris to Macs, Windows, or Amigas, they will compare them to Atari's desktop. It is therefore important that Atari's desktop compare favorably with these competing interfaces.

However, Atari should only do the minimum necessary to provide a favorable comparison. It should not attempt to co-opt the 3rd party developers by implementing all of their improvements. If Atari simply undercuts 3rd party developers, they'll leave the market, and creativity is stifled. I'd rather see Atari bundle NeoDesk than simply copy all their features and leave Gribnif high and dry.

3089. Comparing desktops (WAS Re: Neodesk in ROM)

You all will like this new feature. We have in on the Apple IIGS (but we
call it fill mode). It's really fun to have. I believe the GS version of
Tunnels of Armagedon uses this mode. I've also got a couple of animation
demos that use it. I just with Rainbird would do ports of Carrier Command

and Mid Winter using fill mode :). then I'd be a happy camper!

Collin Douglas

cbdougla@uokmax.ecn.uoknor.edu

P.S. anyone know of a decent CAD for the Atari ST? My roomate has an ST and I'd like to get a CAD. The only PD CADs for the GS are old and bad (old meaning they don't even use GS graphics :(CAD Apple is a little out of my price range :(:( ).

Thanks for any help.

3092. GCC cross compiling on Sun-3

Newsgroup: comp.sys.atari.st
Date: 1990-11-08 09:41:13 UTC
From: waal@cwi.nl
Message-ID: <2499@charon.cwi.nl>
Source record: 237412

Hi,

Can anybody tell me how to cross-compile gcc sources on a Sun-3?
I've tried to compile some sources with the gcc that is installed on a Sun-3
at our site, by:

- forcing it to use the gcc-include files for atari gcc.1.37.1
- undefining symbols like sun, unix, __sun__, __unix__ and __HAVE_68881__
- compiling with -m68000 -msoft-float, -mnobitfield

(all the options seem to be necessary to override the default options)

If I compile sources to assembler files and perform the rest of the
compilation on my ST, everything seems to work, although gcc-cc1 (on Sun-3)
complains about a parsing error at the last closing parenthesis in
<osbind.h>. It produces usable assembler code, though.

I can assemble to .o files , but then the atari linker complains about wrong
object file formats.

Is it possible to use a gcc compiler that is designed for a 68020
architecture with a floating point chip for my purposes, or do I have to
rebuild a gcc version from scratch?

From article <1990Nov6.203608.28993@cs.ucla.edu>, by stephen@oahu.cs.ucla.edu (Steve Whitney):
> This isn't a flame. I can only speak for myself, of course, but the reason
> _I_ keep clamoring for the TT desktop on STs and STEs is to stimulate new
> sales. The new desktop just plain looks better than the old one. Unless you
> bundle DC Desktop or NeoDesk with new STs, the computer people see in the
> stores will have the nasty old desktop while other computers have nice slick
> looking desktops (e.g. Macintosh, new Amigas, Windows 3.0).

While I'm personally very happy to use NeoDesk, I have to agree with the above posting. Most dealers can't be bothered even to put a disk in the machine when they switch it on in their shop, so what potential buyers see is an ST, often with an inferior TV monitor, showing the plain old desktop, in the lowest resolution the machine's capable of, and with that sickly green background.

Atari don't (in the UK at least) supply any demonstration disks to dealers, while many PC/clone suppliers do - and for some reason Amigas are more likely to be shown up & running than STs. The result is a visual comparison of an Amiga running some game or other, a PC clone with an animated spreadsheet/graphics demo, and the sickly green low-res static ST desktop. Amstrad chairman Alan Sugar has been known to talk of the 'mug's eyeful' which helps to sell products in shops. While Atari might feel smug about not pandering to mugs, the firm sure doesn't do much to help sell the STs in dealers' shop windows.

3094. Re: MTOOLS on Sparcs (Was Re: De-archiving)

Newsgroup: comp.sys.atari.st
Date: 1990-11-08 14:06:34 UTC
From: ralph@laas.fr
Message-ID: <RALPH.90Nov8150634@orion.laas.fr>
Source record: 237414

The DUP_FAT #define is not the only patch necessary for MTOOLS to be compatible with an ST. By default MTOOLS writes out an ALL-BLANKS volume id, which makes the Gulam shell not be able to read that floppy. I've already posted my simple patch to comp.sys.sun and maybe even this newsgroup. I am sure that other small bugs are lurking in MTOOLS. Ever try to abort in the middle of an MTOOLS operation?

Cheers,

I recently bought TurboJet from Neocept. I was planning on using the Deskjet GDOS driver and fonts. However, since I bought the product mail-order, it seems that I need WordUP to even unpack the files on the TurboJet distribution disk. I still need a Deskjet GDOS driver so that I can get output from LDW-Power. If any knows where I can get or purchase either a PostScript or Deskjet driver, please mail me a message.

3096. STe vs std ST

Newsgroup: comp.sys.atari.st
Date: 1990-11-08 14:33:22 UTC
From: jlong@radc.af.mil
Message-ID: <1990Nov8.143322.5066@lonex.radc.af.mil>
Source record: 237416

I have the opportunity to swap my 1040ST with TOS1.4 chips in it
for a 1040STe. The only real advantage I can see to making the swap \
is that I was going to upgrade to 4 meg soon, and it should be easier
with the SIMMS in the STe over an expansion board for the ST.
What I really worry about, is that the ST is a 1986 vintage and
has given me good service and the new STe's are an unknown.

What incompatibility problems are going to bite me??

Are the new STe's shipping with the fixed TOS1.6 chips yet?? I would hate
to trash my Hard-drive with this thing!!

Any and all opinions (short ofshort of the "Buy an AMIGA!!" crap) are welcomed!!

That is ridiculous. I have a MacIIcx in front of me with 7 INITS
that load up on bootup and it takes approximately 10-15 seconds to
get the desktop when I power up. I think you are exaggerating.

Hehe, I think what we have here is a case of sour grapes. I don't
know what programs you use,but I use MacIIcx's and fx's on a regular
basis, and I think you are mis-representing the facts.

>Multifinder or the Amiga's?

Ah, now you tell us that you like Multifinder (I do too!) and the
Amiga OS. If you dislike the ST OS so much then why did you buy
one? You'll spend a long time waiting for a decent multi-tasking
OS from Atari. Hell, they are just starting to get the bugs out

of the single-tasking one! The TT doesn't even have a method
of multitasking. It is, for all intents and purposes, just a faster,
more expensive ST. None of the really innovative features of the
68030 are used (oops, they might use the burst fill mode...I'm not
sure). Their version of unix will be out RSN, etc...ad nauseum...

3098. Math symbols in gem

Newsgroup: comp.sys.atari.st
Date: 1990-11-08 14:49:59 UTC
From: swklassen@rose.uwaterloo.ca
Message-ID: <1990Nov8.144959.19958@watdragon.waterloo.edu>
Source record: 237418

I need a package for creating mathematical models in GEM. That is,
I want to be able to draw mathematical formulae (with sums and
infinity and other such symbols) and then print them as a graphic.
Specifically, I need a graphic which can then be imported into
a desk top publisher, for inclusion with the written portion of
my article. (Hence printing the symbols as a GEM metafile is best,
but NEO and other formats are also acceptable.)

Does anyone know of such a package for the Atari?
Would anyone be interested if I wrote one? (please e-mail me
on that one)

Yes. I am trying to create a new plain.fmt, and plain.tex tries to preload the font information for its standard fonts. I am actually using iplain.tex, from the Icelandic font distribution at babel. I created all of the im (=cm) fonts on my ST, but initex rejects the .tfm files!!

>Inimf is not quite so important as is initex. Since my first metafont
>setup I've never run inimf again. But part of the package should then
>be a file like 'plain.base', which should be a 'dumped' version of the
>metafont basics and should contain setup parameters for various printers.

You are right, you need to run inimf only once. However, the standard pk fonts do not come out well on the SLM804 atari laser, and I want to darken them up a bit. I need to define a new mode, and it's a pain loading the file in by hand every time.

Thanks for the help. Does anyone else here know about an inimf for the ST? Or does anyone else have further information? Thanks.

Source record: 237426

Thanks for all the responses folks. If anyone needs to know, he's at jbammi@cadence.com. Although he hasn't actually said as much, I suspect he's moved on from ST's to more hoopy kit (yes, more hoopy computers *do* exist :-)).

I also got a lot a help with my Gnu query. The stab stuff appears by courtesy of the -g (relocate for debugging) flag which *shouldn't* be set.

Now all I have to do is figure out on what days of the week gcc will cope with long command lines. It wouldn't last night, but it would the night before, but not the night before that. I just *love* sophisticated s/w.

See atari.archive for cosh and an ST-executable version of NASA'a CLIPS inference shell. It's not the current version for which they are charging 500 bux, but an '86 version. Nice thick manual though.

3107. Song Files

3109. Are there any original screen blankers out there?

Newsgroup: comp.sys.atari.st
Date: 1990-11-08 22:34:53 UTC
From: n8742883@unicorn.wwu.edu
Message-ID: <1990Nov8.223453.897@unicorn.wwu.edu>
Source record: 237429

While we're on the thread of screen blankers....

I have seen a screen saver for the IBM which places a image of
a computerized fish tank on the screen, and fish go back and forth on
it. When a big fish "hits" a smaller fish, it eats the smaller fish
and grows bigger. The whole effect is rather addictive- esp. at wee
hours in the morning when one's brain has turned to slush.

All of the screen savers I have seen simply turn the screen
off, with the exception of one I got out of STart (ST-log?) which
shoots off little "fireworks" on the screen. Slightly more
interesting, but still quite boring compared to some of the other
screen savers I've seen on other programs.

Has anyone seen any more imaginative screen savers out for the
Atari? I don't care if they are commercial, shareware, or PD.

An interesting screen saver would be an old, old program that
I believe was made by Activision called "The Little People" or
something similar to that. It basically created an electronic
dollhouse, where the user would interact with the programmed "dolls"
moving around the place. It was really an interesting program; does
anyone out there have it and be willing to part with it?

Well, if you really want to know....

If you want serious work, good god man, buy a Spectre GCR. You can run Wingz, Excel, and many other spreadsheets for the MAC. And take the work with you the next morning...(Gosh, am I the only that doesn't do real work on the GCR?).

I think most people will tell you on here, back me up people, the Spectre can do very serious work in spreadsheets, dtp, and even games.

cmm1@cunixa.cc.columbia.edu (Christopher M Mauritz)

- That is ridiculous. I have a MacIIcx in front of me with 7 INITS
- that load up on bootup and it takes approximately 10-15 seconds to
- get the desktop when I power up. I think you are exaggerating.

Next time you're in the area, bring your stopwatch and a magazine to
read. I'll show how long it takes to boot. And that's even when
by-passing SAM.

- Hehe, I think what we have here is a case of sour grapes. I don't
- know what programs you use,but I use MacIIcx's and fx's on a regular
- basis, and I think you are mis-representing the facts.

I use Persuasion 2.0. Pixel Paint Professional. Not to mention
Illustrator, Freehand, Zing!, MacDraw II, MicroSoft Word 4.0 and a
couple of others I use on occasion that I can't remember. Since I
use Persuasion a lot more than the others, I notice the drive reads
more on it.

- Ah, now you tell us that you like Multifinder (I do too!) and the
- Amiga OS. If you dislike the ST OS so much then why did you buy
- one? You'll spend a long time waiting for a decent multi-tasking OS
- from Atari.

I didn't say I disliked the ST OS. I said I wish it had multitasking
implemented. In fact, I prefer the ST OS to the Amiga's, Mac's,
MS-DOS, Unix. It's quick and painless.

And I don't necessarily want a multitasking OS from Atari. In fact,
I'd prefer one from a third party 'cause I know they'd update it more
frequently and give it better support than Atari could.

Enough of this bickering. Other people don't want to see it. If you
want to continue it, reply to it via e-mail.

jlong@radc.af.mil (Jeff Long) writes:

- I have the opportunity to swap my 1040ST with TOS1.4 chips in it for
- a 1040STe. The only real advantage I can see to making the swap \
- is that I was going to upgrade to 4 meg soon, and it should be
- easier with the SIMMS in the STe over an expansion board for the ST.

I bought my STe for the TOS upgrade and easy memory expansion. I wanted Rainbow TOS and I was going to get a RAM upgrade sooner or later. TOS 1.4 costs over $100 locally. A RAM upgrade, who knows? It would cost more than I want to think about. I sold my unexpanded, 1988 1040ST for $450 at the end of July 1990 and bought an STe for $600. So, that's a $150 TOS upgrade. Plus I got all the other features of the STe, like stereo sound, blitter (no biggie), 4096-colors(no biggie yet), plus a brand new computer. When I want to upgrade to 2megs, it'll cost me less than $90.

- What I really worry about, is that the ST is a 1986 vintage
- and has given me good service and the new STe's are an unknown.

They aren't an unknown. (Maybe to you perhaps.) I really like my STe. Wouldn't exchange it for anything but a TT. And that includes a Mac; I'd sell the Mac and use the money for my STe.

- What incompatibility problems are going to bite me??

If you play games, there are a few that don't work. I haven't had any compatibility problems with the utilities I use. On the whole, the incompatibility problems are non-existant.

- Are the new STe's shipping with the fixed TOS1.6 chips yet?? I
- would hate to trash my Hard-drive with this thing!!

The problems with the hard drives has been fixed for some time, and they weren't even due to TOS. I'm happily running a 50meg (ST-157N-1) ICD hard drive on my BBS with no problems.

I found a screen saver called IDLE that has a neat display:
blinking stars with a spinning, bouncing fuji symbol. It can
run as an .acc or a .prg... Unfortunately I don't use it
because although there is a way to set certain parameters, I
could never get the parameters set so that it wouldn't
interfer with the com port. Well, I think the screen looks
neat, so if anyone wants to tell how set IDLE up so that it
doesn't interfer with the com port, I'd be happy to hear it.

3120. Lombard Rally

Newsgroup: comp.sys.atari.st
Date: 1990-11-09 05:27:38 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1990Nov9.052738.12240@lsuc.on.ca>
Source record: 237440

First, I should again say thanks for all the help I received regarding the Line-A stuff. That work is going along smoothly for now.

Aside from that, today I bougth Lombard Rally from Mandarin Software and as a driving simulation it's about as good as late ST (pre-STE) software gets. I'm hoping we'll see some better stuff now that we have true proportional joystick capabilities on the STE. But the real question I have has to do with copy protection. I read through the manual and the box and there's no mention of either copy protection or lack thereof. So the first thing I tried was to back up the disks and run off backups. I found the following:

NOTE: I'm running a 1040ST with Rainbow TOS 1.4

1. I formatted a fresh double sided disk and copied all the files from Disk 1 onto it. Then I followed this with all the files from the Data Disk. It booted in part, but the openning music was mainly noise. It seems that the sound is being picked off from the wrong places. Essentially, it didn't seem to work.

2. I then reformatted the same disk as a single sided disk and copied the files from Disk 1 onto it. This worked a bit better. The sound was still messed up, but it seemed to run without problems, as long as I used the original data disk.

3. I tried to backup the Data disk onto the new single sided disk, but this didn't work. The backup routine would not finish reading the whole of the data disk. This is curious because there wasn't any problem reading the files the first time I did the file-by-file copy to the double sided disk.

My conclusions are as follows:

It does NOT seem that the game was meant to be generally copy protected. I expect that what they have done is to put the music on the "unused" side of a single sided formatted disk. This would explain why the game seems to play from my backup of the Start disk, but has messed up music (from the first time I formatted the disk and copied it onto the "working" copy disk).

Most likely, the final tracks of the "Data" disk aren't even formatted. This is a normal expedient used by game companies.

Does anybody know whether this is correct?

Cheers! -- Jim O.

I've included the entire previous message because it is worth repeating.

In fact, it is worth repeating everyday until the end of the year (but I won't do that to y'all :-).

The situation is seriously wrong at Atari and their thinking is all backwards, at least with middle to upper management.

As one of the 'alternate' desktop manufacturers, we have openly posted that we are completely in favor of Atari releasing the NewDesk to any machine it can possible work on. Why?

It will sell more machines, and the market for us poor starving developers may pick up as a result.

Please, PLEASE, break your inertia of rest and write a letter (even a postcard) to Sam Tramiel at Atari at the above address.

The United States market is shriveling up, and unfortunately, Atari is too caught up in personal problems to see anything but their own misgivings.

Optism we have. Power you have, please write Sam Tramiel.

- Mike Vederman / Double Click Software

BTW - thanks for the post Steve, it is well worth saying over and over again.

Unfotunately, DAs can not have menu bars. At least not without some serious trickery.

DAs are not in the message queue for receiving menu messages. GEM doesn't even give them a second thought for receiving messages from menus.

Best solutionis to install you own mouse handler and monitor x & y mouse coords and simulate a working menu bar. Of course, you must restore the old menubar after you are done.

Well, Jeff's entitled to his opinion here, but the fact remains that NeoDesk's a pretty popular program. I don't know what the average janitor makes in Hadley, Mass., but judging from the time it's taking Gribnif to send me my NeoDesk upgrade, they're shipping a goodly number of copies and are probably making enough to get by.

If the ST had had as much time & money put into its desktop as the Mac, no doubt it would be faster, smoother, more fully-featured, etc. But it would all have to be paid for somehow.

(I agree that with better management Atari could have got a lot further, though.)

If NeoDesk were in ROM/EPROM/Cartridge format, wouldn't it have the same upgrade problems as the built-in desktop?

3126. BackupST a must have!!!

Newsgroup: comp.sys.atari.st
Date: 1990-11-09 13:04:36 UTC
From: Bill_von_Hagen@TRANSARC.COM
Message-ID: <EbCeZYT0BwwuJF1FAS@transarc.com>
Source record: 237446

This is an enthusiastic recommendation for the new (freeware) backup program called BackupST and its front end Bfront. A notice about the availability of these programs was posted a few days ago by Edwin Kremer (edwin@praxis.cs.ruu.nl). The program's author is Fred Appelman (fred@cv.ruu.nl). I have nothing to do with the software, aside from being an ecstatic user.

As far as I`m concerned, these programs do all the right things - they're fast, easy to use, and have some really whizzy features that I've not found in commercial backup software (of which I own a few different packages). I find them much easier to use and more useful than other program such as "turtle" and "vault". (These are just my opinions, but I'm happy with them.) Anyone who finds the BSD UNIX "restore" program's interactive mode intuitive and useful will want this program.

I got the package from the site mentioned by Edwin (archive.cs.ruu.nl [131.211.80.5]), but I plan to forward a copy to atari.archive.umich.edu. Could someone please tell me how to do this. It's in your best interests!!!!

Here's an excerpt from Edwin's description of the program:

> BackupST treats a set of floppy's like a stream of data: no floppy disk
> space is wasted by creating subdirectories etc. Compare it to the UNIX
> "tar" utility if you wish. One of the best things of BackupST is its
> powerful restore mechanism (yes, you really might want to restore some
> files occasionally :-]). I like the interactive restore best: people
> familiar with the interactive-restore-mode of the UNIX "restore" command
> will encounter no problems at all using this facility.
>
> BackupST
> --------
> this is the low-level program that does all the dirty work; this
> is typically something that you use from within your favourite
> shell (command line interpreter). Yes, is has __many__ options ;-)
>
> Bfront
> ------
> this is the GEM frontend for BackupST: once you've seen it, you'll
> never find yourself going back to using the low-level program...

If someone will explain how to upoload to atari.archive, and where to put things, I will upload this today.

Once again, I have nothing to do with the program, other than being able to recognize (this time, at least) truly excellent software when I see it.

Bill

3128. Re Sozobon C & Mupfel (Summary)

Newsgroup: comp.sys.atari.st
Date: 1990-11-09 13:16:58 UTC
From: jvt@its.bt.co.uk
Message-ID: <{=%^*=$@uzi-9mm.fulcrum.bt.co.uk>
Source record: 237448
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

THE ORIGINAL QUESTION: How do you stop Sozobon C and programs compiled
by it crashing under Mupfel (Gemini's Shell).

Thanks to Ant <ant@mks.uucp> and Bob <balkwill@encs.dnd.ca>
for responding to my posting. Their advice was to fix the bit
manipulation code in the assembler and the memcpy()/memmove()/bzero()
fns in dlibs. Basically this worked, but not without problems.

The first thing I discovered was that I had 1.01 of Sozobon so I obtained
1.2 and remade *everything* = MAJOR MISTAKE. This caused every thing in
sight to behave strangely. My application, which runs under Unix, MS/DOS
and TOS1.6+Gulam fell apart at initialisation, Sz Make could not find
cc,jas etc when run under Mupfel (yes it did not bomb) but it was
OK with Gulam. After *much* tracing I found the problem in a fn call
where fn(&structure, int1, int2) produced *strange results*. It seemed
the params got scrambled with int2 taking int1's value, int1 became 0
and the pointer was left alone. Recoding as
fn((long)&structure, int1, int2) got it to behave but at this point I
decided things had become *extremely* *silly* and there must be some
other cause.

I decided the only way was a structured approach taking each change
at a time. The biggest problem was actually knowing which mods to
make. So many fingers being in the pie and an absence of any
controlled release of patches from the authors makes the whole thing
a nightmare. OK thats enough of the moans - here is what I did the
second time through, starting with the original 1.01 binaries & sources.
At each numbered stage the resulting code is installed.

ACTION EFFECT

1: Modified dlibs12 alloca.s bzero.s Application still bombs
memcpy.s as in Tohru Nishimura's
Mailing.

2: Corrected the hcc bug in fun.c from No Test
a reposting from Johann Ruegg (the
only note I have from an Author!!!)

3: Corrected jas opcodes.h - again No Test
Tohru's posting. Two worries here
a) I found another & completely
different version of opcodes.h
purporting to fix the same bug!!!!
Sorry I have no details, they're

on the m/c at home.
b) Tohru's explanation of the faulty
lines does not match his diff output.

4: recompiled dlibs functions of 1: plus Application now runs OK
lmemcpy.s which also had a bit instr.

5: Make *all* binaries including Application & Compiler runs OK
upgrades to hcc 1.2 and top 1.2
also mods to peep2.c peep3.c
reposted by Michal Jaegermann.

I have not installed the mods to initargs.c from lrh or top1.2x from Tohru.
This is because it now works and these unofficial patches, while maybe
being a good thing , will only stack up problems should 1.3 or
whatever be released.

OK thats it. I hope this tale will help others to avoid the pitfalls.

As a parting shot - A MESSAGE TO THE AUTHORS, how about releasing
patches on a regular basis through c.s.a. Then there would be no
confusion and an otherwise excellent package would not be spoilt
by poor followup.

John

3129. Re: diff files

Newsgroup: comp.sys.atari.st
Date: 1990-11-09 15:49:51 UTC
From: ralph@laas.fr
Message-ID: <RALPH.90Nov9164951@orion.laas.fr>
Source record: 237449
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Diff files which might look like .dif on an Atari ST (mine are usually
.pat or .pt2, etc.) are handled by PATCH.TTP. I have already
discussed its existence some time back in comp.sys.atari.st
<RALPH.90Jul24142739@cresus.laas.fr>:

| By the way, do you STers ever use `patch' on your ST to update
| sources from USENET? I recently used it to update Sozobon 1.2
| according to the patches posted in comp.sys.atari.st. It's great! It
| was ported by John R. Dunning. Maybe someone should post an updated
| version to the net.

May I remind you folks: IT'S GREAT!!!!

3130. Cross-Compiling on a SUN

Newsgroup: comp.sys.atari.st
Date: 1990-11-09 16:24:56 UTC
From: jlong@radc.af.mil
Message-ID: <1990Nov9.162456.27441@lonex.radc.af.mil>
Source record: 237450
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I find myself in the unique position of getting to play with my favorite toy at work!! We are using an Atari to drive a digital error injector unit that is able to inject random errors into any digital link up to T1 rates. We have been compiling using MWC, but to get really quick we would like to use GNU-C on either our SUN-3s or one of our SPARC-stations. I know the ports to cross-compile on a sun were maintained by Jwar Bammi (sp?) at dsrgsun.ces.cwru.edu, but that machine hasn't answered the internet in ages.

Does anyone know where else I can ftp the stuff I need to set up a complete cross-delevopment system on a SUN to compile some straight-forward TOS type programs for the ST (no GEM stuff). We hope to develop on the SUN, dump to

the atari using the RS-port and execute away. I would really appreciate it if someone could help me out on this, as I have long been the lone ATARI fanatic here at work and would like to capitalize on this golden opportunity to show the MS-DOS types here in the lab what our trusted machine can do!!

I would appreciate talking to someone who has done this type of cross-compiling ASAP!! Please leave me E_mail or post the replies if you can't get to me using either of these addresses:

3131. Mac ROMS ?

Newsgroup: comp.sys.atari.st
Date: 1990-11-09 16:36:49 UTC
From: brunner@ltisun7.epfl.ch
Message-ID: <1151@disuns2.epfl.ch>
Source record: 237351

I am looking to buy official and legal copies of Mac 128k ROMS, or
even better, Mac SE 256k ROMS.

Does somebody have a good address for low prices ?
Also, what would be a good price for these ROMS ?

To avoid warnings, like, "Spectre GCR doesn't support 256k ROMS", or questions,
like "Is there a Mac SE emulator for the atari on the way ?", here is the
answer: no, this is not for the atari, but for experimental projects I have.

Please e-mail directly (I will summarize for the net), or post in this news-
group that I read daily.

Beat Brunner e-mail: brunner@lti.epfl.ch

Whatever happened with the ZX81 emulator. I'd love to get a copy.
Could someone in England (I suppose) send it to atari.archive?

Thanks,
Randy Hosler randyh@hpsadpk

3133. ATARI ARCHIVE CRASH

Newsgroup: comp.sys.atari.st
Date: 1990-11-09 17:26:14 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1990Nov9.172614.4330@terminator.cc.umich.edu>
Source record: 237353

Ok, perhaps I was a bit hasty when I said everything.... (Did I say everything?)
At any rate, only uploads made after SEPT. 19, 1990 are lost. This however
does include such gems of the atari community such as Mint (please Eric,
resend them), many of Ed Krimen's demo uploads, many of Todd Miller's
uploads, etc.

If you did upload something recently and still have it laying around,
please resend it.

And remember to let me know what it is, as stuff is already flooding in...

Thanks,
weiner

> figure out is why this particular include appears, as no other one does.

I don't know which version of gcc is on terminator, but the versions
derived from Jwahar Bammi's port should understand slashes (/) instead
of (\) as the directory delimiter.

> Anyway, I'm still getting "Bogon Alerts" from the compiler, even when I
> double-backslash the paths. What concerns me is that this is standard GNU
> distribution fileutils, GNU C shouldn't have a problem compiling it. O.K.,
> whether it runs or not is another thing, but it should compile up OK.

These bogon-alerts come from a bug in the linker when you link with
symbol table included (they use a wrong comparision function that
cannot distinguish all three possible arrangements of the
input-params). If you link with -s (no symbols), these bogon alerts
should go away.
BTW. I have compiled the fileutils with almost no changes (except in
the Makefile).

> I started to consider whether the GNU C port had some problem (after
> playing around with GNUINC = this-n-that for a while. It made no
> positive difference.

You could of course put strings.h in the current directory, so it
would't need any directory delimiter in the above .stab entry.

> Any ideas anyone?
> Gray (ever puzzled)

You could try the gcc version and library at cs.uni-sb.de.

Hope this helps!

- Edgar

3135. Should I switch to Minix St?

Newsgroup: comp.sys.atari.st
Date: 1990-11-09 18:28:52 UTC
From: david@doe.utoronto.ca
Message-ID: <1990Nov9.182852.14628@doe.utoronto.ca>
Source record: 237354

I have read the info sheet on Minix ST 1.5 from comp.os.minix, but
I still have a couple of reservations. People like David Beckemeyer and
Eric Smith have been working very hard to stretch TOS to its limits,
but TOS is not (and will never be) Unix. I'm wondering if, instead of
spending all my time getting everything to run under MiNT, I should
just take a couple of partitions (I have 115 MB of disk space now)
and install Minix ST.

How many of you are using Minix? I know that there have been many
improvements in the new version. Minix is supposed to be V7 compatible.
Does that mean that -DBsd in a cc command line is enough to compile
Unix code for Minix? Is job control possible? Is this a stupid idea?
I'd hate to have to shell out $200 (Canadian, approximately) for Minix,
but I guess it's really quite cheap.

Please post your comments if you think that they are of general interest
(anyone who doesn't like this thread doesn't have to read it), or
mail them to me if you think they are not. Thank you.

```
Atari 520 ST (512K) (Manuals INCLUDED!)
- Original TOS in ROM with external power supplies (Higher power capacity)
- SM124 (Monochrome) 600 x 400 display
- Built-in RF modulator for use with color TV (great for games)
- Atari SF354 360K (3.5-inch single-sided) floppy drive
- Future Systems GT100 720K 3.5-inch double-sided floppy drive
- MIDI port, RS232 port, Centronics Parallel printer port (all with
industry-standard connectors!)
- Mouse
- 2 joystick ports for standard Atari/Commodore joysticks
- DMA port for hard disk
Software (commercial titles include documentation - NO PIRACY!):
- Microsoft Write (with GDOS)
- Publishing Partner 1.03
- PageStream 1.51
- Magnetic Images Postscript Screen Fonts
- GFA BASIC 2.0
- ST BASIC
- Typing Tutor/Word Invaders
- The Black Cauldron
- Time Bandit
- Uniterm 2.0e
- KA9Q Amateur Packet Radio with SLFP mods
- PE1CHL Amateur Packet TCP/IP with conferencing and support for dual-port
KAM or KPC-4 TNCs
- Gulam, Gemini, Sozobon C, UnixTkit, tons of other utilities
- UUCP package
- etc, etc, etc. Over 100 disks worth of stuff!

$750 or best offer - you pay shipping outside of Metro Detroit
---------

Kantronics KAM TNC
- Full multi-mode TNC
- Supports simultaneous HF and VHF (or dual VHF) operation
- KISS mode
- Version 2.85 firmware
- 32K static ram with battery backup
- Smart Watch timekeeper
- Cables, manuals, original box!

$250 or best offer - you pay shipping outside of Metro Detroit
```

>>>>>>>>S P E C I A L<<<<<<< Buy both of the above together for a complete Packet Radio station for $900!

Heathkit HW-8 QRP CW
- Only modification is a BNC instead of an RCA antenna jack
- Original builder - original manual.

$65 or best offer - you pay shipping outside of Metro Detroit

----

Kenwood TR2200 portable 2-meter FM rig
- All 12 channels crystalled
- Manual
- Needs new NiCad packs

$45 or best offer - you pay shipping outside of Metro Detroit

----

Tandy CoCo 2 for parts - needs new 74LS783 Memory Controller
- 64K
- Extended BASIC

$25 or best offer - you pay shipping outside of Metro Detroit

All of the above in excellent condition except as noted.

Inquire by e-mail or call:

(313)484-9320 8:00AM to 4:00PM EST
(313)728-3930 6:00PM to 10:00PM EST weekdays, any time on weekends.

Help me clean out my stuff - make me an offer I can't refuse!

3138. 16-bit (ST) meeting Wed Nov 14/90

Newsgroup: comp.sys.atari.st
Date: 1990-11-09 19:47:14 UTC
From: daroloson@watmath.waterloo.edu
Message-ID: <1990Nov9.194714.9219@watmath.waterloo.edu>
Source record: 237357
Cross-posted to: uw.sys.atari,comp.sys.atari.st,comp.sys.atari.st.tech

Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST) Atari user group
16-bit (ST) - Wednesday, Nov 14, 1990
DCS Course Room, Room 2009 (2nd floor)
Math & Computer Building, University of Waterloo
Room opens at 7:00 pm. Meeting starts at 7:30 pm.

The following is a list of new items that I personally will
be bringing to meeting. If they are not discussed in the formal
part of the meeting, they will be available for demonstration during
the casual segment.

* Megafile 44 removable hard drive

* NeoDesk 3
NeoDesk CLI (Command Line Interpreter)
NeoDesk Icon Disks

* Universal Item Selector III

* Mug Shot (police identification kit type program)

* Word Quest Powerpack (crossword and word search generators)

* Games Galore (4 STOS games)

* Telegram (Kid program)

These products and more will also be reviewed in this month's "The Hard Copy"
which should be our biggest issue ever.

Also in this month's issue:

* Report about Atari Canada at the last Brantford meeting.

* Report on the WAACE show in Washington (Hope to get video before meeting).

* Info on the Canadian Computer Show and Windsor/Detroit International
Atarifest

* Other news and reviews

Also, at this meeting members will receive a disk containing the catalog
of the newly re-organized library.

The ST meeting is also the deadline for article submissions in the Cordless
Mouse contest. The new item from Practical Solutions, the Video Key,
will also be at the meeting.

>...
>Jeff Gortatowsky {seismo,allegra}!rochester!kodak!elmgate!jdg

Personally, I don't think 'fuddling with' will give you a proper feel for an alternative desktop's value - it's the sort of product that you make judgements on after weeks of using and finding what works well and what seems poorly implemented.

After a couple of months with Neodesk 3 (sorry to those of you still waiting on upgrades!) I feel that it is an excellent operating environment. I used Gemini predominately before Neodesk 3 and was impressed, but Neodesk has implemented most of Gemini's features (except built-in CLI and 'small' icons, but the CLI accessory makes up some of the difference, and the icons in Neodesk are more easily edited).

Gemini simply took up to much memory (I have 1 meg), and GDOS was incompatible with too many programs.

Do you have any specifics of the Windows or Mac desktops that you think Neodesk lacks?

3142. SliccTop: What is it?

Newsgroup: comp.sys.atari.st
Date: 1990-11-09 20:22:18 UTC
From: steve@thelake.mn.org
Message-ID: <A1925780841@thelake.mn.org>
Source record: 237361

I'm seeing vague references to yet another ST multitasker on the Citadel BBS network. The name is SliccTop, and it supposedly multitasks GEM and TOS programs. If anyone has further info, especially a press release, I'd appreciate receiving a copy.

Steve Yelvington / P. O. Box 38 / Marine on St. Croix, MN 55047 USA

MORAL GOES AT THE FRONT OF THE STORY: Don't buy [insert product name here]
from Neocept!

> I recently bought TurboJet from Neocept.

Ooh, bad move. (I retract all nice things I ever said about Neocept.)

> I was planning on using the
> Deskjet GDOS driver and fonts. However, since I bought the product
> mail-order, it seems that I need WordUP to even unpack the files on the
> TurboJet distribution disk.

Hi Wesley,

Yeah, I got burned by Neocept too. Exactly the same scenario you described.
I wrote them a "dissatisfied customer" letter, asking for a fix or my money
back, but I haven't heard from them yet.

MiGraph, in Federal Way, Washington, makes a bee-yoo-tiful set of DeskJet
fonts & drivers. It only costs $5 ($10?) more than TurboJet. Sorry I don't
have address & phone, but you can get the phone # from Directory Assistance.

MiGraph are the people that make EasyDraw and some other cool GDOS stuff.
We used their fonts and drivers at HP in Corvallis, when "evaluating" the
DJ series with [non-HP] computers. I recommend them highly. And as soon as
I get my money back from Neocept, I'm going to order my own set!

> rrd@hpfitst1.hp.com

Hi Ray,
I've tried e-mailing you before with other replies but I keep getting
bounced mail. Not sure why. Anyway...
I have MacPrint, and yes it is a very good software package, but it
does not support Epson printers. It only handles HP-PCL printers.

3145. cpm emulator...

Newsgroup: comp.sys.atari.st
Date: 1990-11-09 20:49:28 UTC
From: millert@tramp.Colorado.EDU
Message-ID: <29497@boulder.Colorado.EDU>
Source record: 237364

Has anyone gotten the cpm emulator on atari.archive to work? The emulator
itself seems ok, but make_cpm bombs when I try to create a cpm disk.
And, yes I used it on a single-sided desktop formatted disk. It even bombs
when I boot "clean" (ie no accs, only foldrxxx in auto folder)

Any help would be appreciated.

suhonen@funic.funet.fi

Oops, a little late in the conversation but I think I have an answer.
On my Mega4 w/Spectre I get 3800K of available Mac memory. I have a few inits with the largest being Adobe Type Manager. After ATM and MultiFinder loads, I'm left with about 2800K of Finder memory. So if all you need is 2500k for Think C and debugger then it should work (whether the debugger works, I don't know but could find out)

And yes, 4meg STacy's are available in the US. Go to your local, *ehem* regional dealer.

3147. Re: Menus and ACC

Newsgroup: comp.sys.atari.st
Date: 1990-11-09 21:00:55 UTC
From: rosenkra@convex.com
Message-ID: <108492@convex.convex.com>
Source record: 237366

i have done this sort of thing before, albeit with apps not DAs. however, i ran into a problem with detecting mouse clicks in the top 19 pixels of the screen (i.e. menubar area). it is not tricky at all, and should be 100% legal to thro up a narrow dialog box at the top and simulate the panes with another dialog. tim oren's tutorials will help here.

i have also tried to fool GEM into thinking that the menubar was actually not at the top, but in some arbitrary location on the screen with limited success. it would be nice if GEM would allow the location of the menubar and its shape to be user specified...

i have developed a menuing system for generating arbitrary "ladder" menus with overlapping sub menus, ala workstations (sun, X, etc). one of these days i will post it (or sell it :-)...

3148. cooltet.arc

Newsgroup: comp.sys.atari.st
Date: 1990-11-09 22:52:01 UTC
From: depeche@quiche.cs.mcgill.ca
Message-ID: <8@bart.cs.mcgill.ca>
Source record: 237367

About a month ago, I came across (from where, I can't remember - maybe it was binaries, maybe it was atari.archive) a file called cooltet.arc, which contained a very nice version of tetris. It was shareware.

Unfortunately, when I reformatted my hard drive, I thought I had made a backup of that directory but it turns out I didn't, so I said to myself "that's ok - it will still be on terminator", but alas, it's gone!!!

If any of you have it, could you please upload it to atari.archive?

and if you haven't tried it, try it!! it is excellent.. As soon as I get it again I will find out what the author's address is and send in my contribution!

I finished Greymoon a long time ago, and got a unicorn on the 15th level.
Pacman also gives you an artifact for merely completing all 16 levels.
I have tried for quite a while to finish a couple of the other levels but
I stopped trying a long time ago.

Source record: 237371

steve@thelake.mn.org (Steve Yelvington) writes:

- I'm seeing vague references to yet another ST multitasker on the
- Citadel BBS network. The name is SliccTop, and it supposedly
- multitasks GEM and TOS programs. If anyone has further info,
- especially a press release, I'd appreciate receiving a copy.

I saw it at San Jose WOA. It wasn't much at the time, but it seems like he's (forget his name) fixed it up since then, from what I've heard. It wasn't doing anything at the show, and I don't even think he had multitasking implemented then. It was one of things that "will have this and that." The desktop was pretty plain-looking, but I guess he had something special under the hood.

I just pulled out the flyers I got at the show, and he calls it "priority-tasking," not multitasking. If you want, Steve, send me a SASE and I'll make a copy of the two flyers for you to drool on. :^) Leave me e-mail for my address. And I'll be away Thanksgiving week.

X1990/11/10
X
X I have finished working up the Line_A support as far as I
Xneed it for the time being. As such, I have no intention to
Ximpliment any more. In saying this, I should note that I don't
Xreally have enough information onhand to finish all the possible
Xfunctions anyway, though I have enough to do a fair bit more than
XI have.
X
X This file set includes the following:
X
X1. 'line_a.h' is the header file I'm currently using. It is based
```

```
X on information from "Atari ST Internals" (Data Becker).
X
X2. 'line_a.s' is the actual assembly source code for Sozobon C
X version 1.2. NOTE that the individual functions can be separated.
XThe transition marker lines are in the following format:
X
X; *** End of functionname ***
X
XIf you search for the 3 asterisks you'll find the transition markers
Xand just have to "cut out" what you need.
X
X3. 'grtest.c' is a crude test program I used to test the functions.
X There is some imbedded documentation in the file.
X
X All the files in this set are PUBLIC DOMAIN.
X
XCheers! -- Jim O.

3154. Re: diff files

Newsgroup: comp.sys.atari.st
Date: 1990-11-10 15:18:55 UTC
From: longj@lonex.radc.af.mil
Message-ID: <1990Nov10.151855.17690@lonex.radc.af.mil>
Source record: 237374
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

After 3 weeks sweating to get NetNews support in out lab, I finally get it working.....and 1 month later---our main mail-serving machine, the one I was getting my NNTP newsfeed from, goes public with NetNews for all its users to use!! Isn't that the way it always works with computers??

Anyway, the purpose of this posting is to see if anyone can steer me to an alternate source for the GNU-C ATARI<->Sun cross-compiler. As we all seem to have discovered, Jwahar Bammi seems to have been transported out of this galaxy by aliens looking to use his prolific programming skills for their own purposes (in other words, he hasn't been heard from on the net in a long time) and he maintained the complete set of programs I needed.

Could some kind soul please point me in another direction for this information?? FTP is the prefered means of getting the files!

Capt Jeff Long
longj@lonex.radc.af.mil or jlong@cassiopeia.radc.af.mil

PS: the purpose of this repost is to make sure the transition locally of the News program didn't keep my last plea for help from making it outside of our own local domain.

3155. Re: uniterm and delete key

Newsgroup: comp.sys.atari.st
Date: 1990-11-10 15:22:19 UTC
From: rcdsdgx@dutrun.UUCP
Message-ID: <3639@dutrun.UUCP>

In article <7340024@hpfcso.HP.COM> rrd@hpfcso.HP.COM (Ray Depew) writes:
>> Uniterm 2.0e
>
Can anybody tell me how to send a delete-character (ASCII hex 7F, octal 177)
to the serial port from the definition of a function-key ?
I am using V2.0e11. I tried using the delete-key, but it deletes the last
char from the definition. I tried send('\177') , which gives an error, since
the char foillowing the backslash is not zero. I tried send('\0177'), which
sends ctrl-N followed by the character 7, since \0 can only be followed by
2 more digits.

Thanks ahead for sharing your knowledge.
